*open***CPS**

Open Cyber-Physical System Model-Driven Certified Development

- Duration 3 years, December 2015 to December 2018
→ continues in the **EMBRACE ITEA3** project.
- 4 countries: Sweden, France, Finland, Hungary
-  Current status: 46.5 person-years, 6.5 M€, 18 partners

Consortium Overview

Industrial Domains & Applications

- **Sweden**
- Equa Simulation
- Ericsson
- KTH
- Linköping University
- **Saab**
- SICS East
- **Siemens Industrial Turbomachinery**
- SKF

France

- CEA LIST
- EDF
- ESI Group
- Inria
- RTE
- **Sherpa Engineering**
- SIREHNA

Finland

Top 3 Key Innovation Areas Targeted Innovations

- Validation of project results in a **wide range of advanced industrial demonstrators!**

OpenModelica

Top 3 Key Innovation Areas

Targeted Innovations

- **FMI run-time and master simulation framework including UML/Modelica Interoperability**
 - Scalable, reliable co-simulation of discrete-time software parts with continuous-time physical processes, designed for **handling large numbers of events**
 - **Integration of the UML and Modelica domains** utilizing the FMI standard
 - Open source **FMI Master Simulation Tool**
- **State Machine and Real-Time Debugging & Validation**
 - Industry-strength support for **advanced state-machine modeling and debugging**
 - Several levels: limited debugging of connected black-box FMUs, full debugging capabilities for components for which the model source code is available
- **Efficient Multi-Core Simulation**
 - Improved compilation and simulation capabilities for **large models**
 - Several levels: coarse-grained, **running whole simulations and/or FMUs in parallel**, to more fine-grained by **parallelization of equation models and algorithmic code** inside model components

Background:

Functional Mockup Interface

- FMI (Functional Mockup Interface)
 - Emerging standard for multi-domain simulation
 - <https://fmi-standard.org/>
 - Encapsulation of component level information
 - **FMU (Functional Mockup Unit)**
- Enables multiple compliant modeling and simulation tools to interoperate
 - **Co- simulation:** encapsulation of simulation models and simulators into black-box components
 - **Model-exchange:** black box simulation model with API for external simulator
- Particularly interesting for designing CPS (Cyber Physical Systems)
 - Heterogeneous systems → different skills and paradigms → specific modeling and simulation tools. (Modelica, Simulink, Dymola, etc.)
 - Lack of apparatus for large-scale simulation design

Background:

System Structure and Parameterization of Components (SSP)

- Definition of large scale simulation scenarios
 - Extending the FMI standard
 - Encapsulates system level information: defining complex simulation scenarios
 - <https://github.com/modelica/ssp-standard-dev>
 - Standardized (SSD- XML)
 - Simulation design and connection definition
 - Simulation parameter definition
 - Harmonization with corresponding OMG and ASAM standards
- Supporting all stages of development process (architecture definition, integration, simulation, test in MiL, SiL, HiL).

T6.5- Automotive demonstrator

Energy and resource optimization

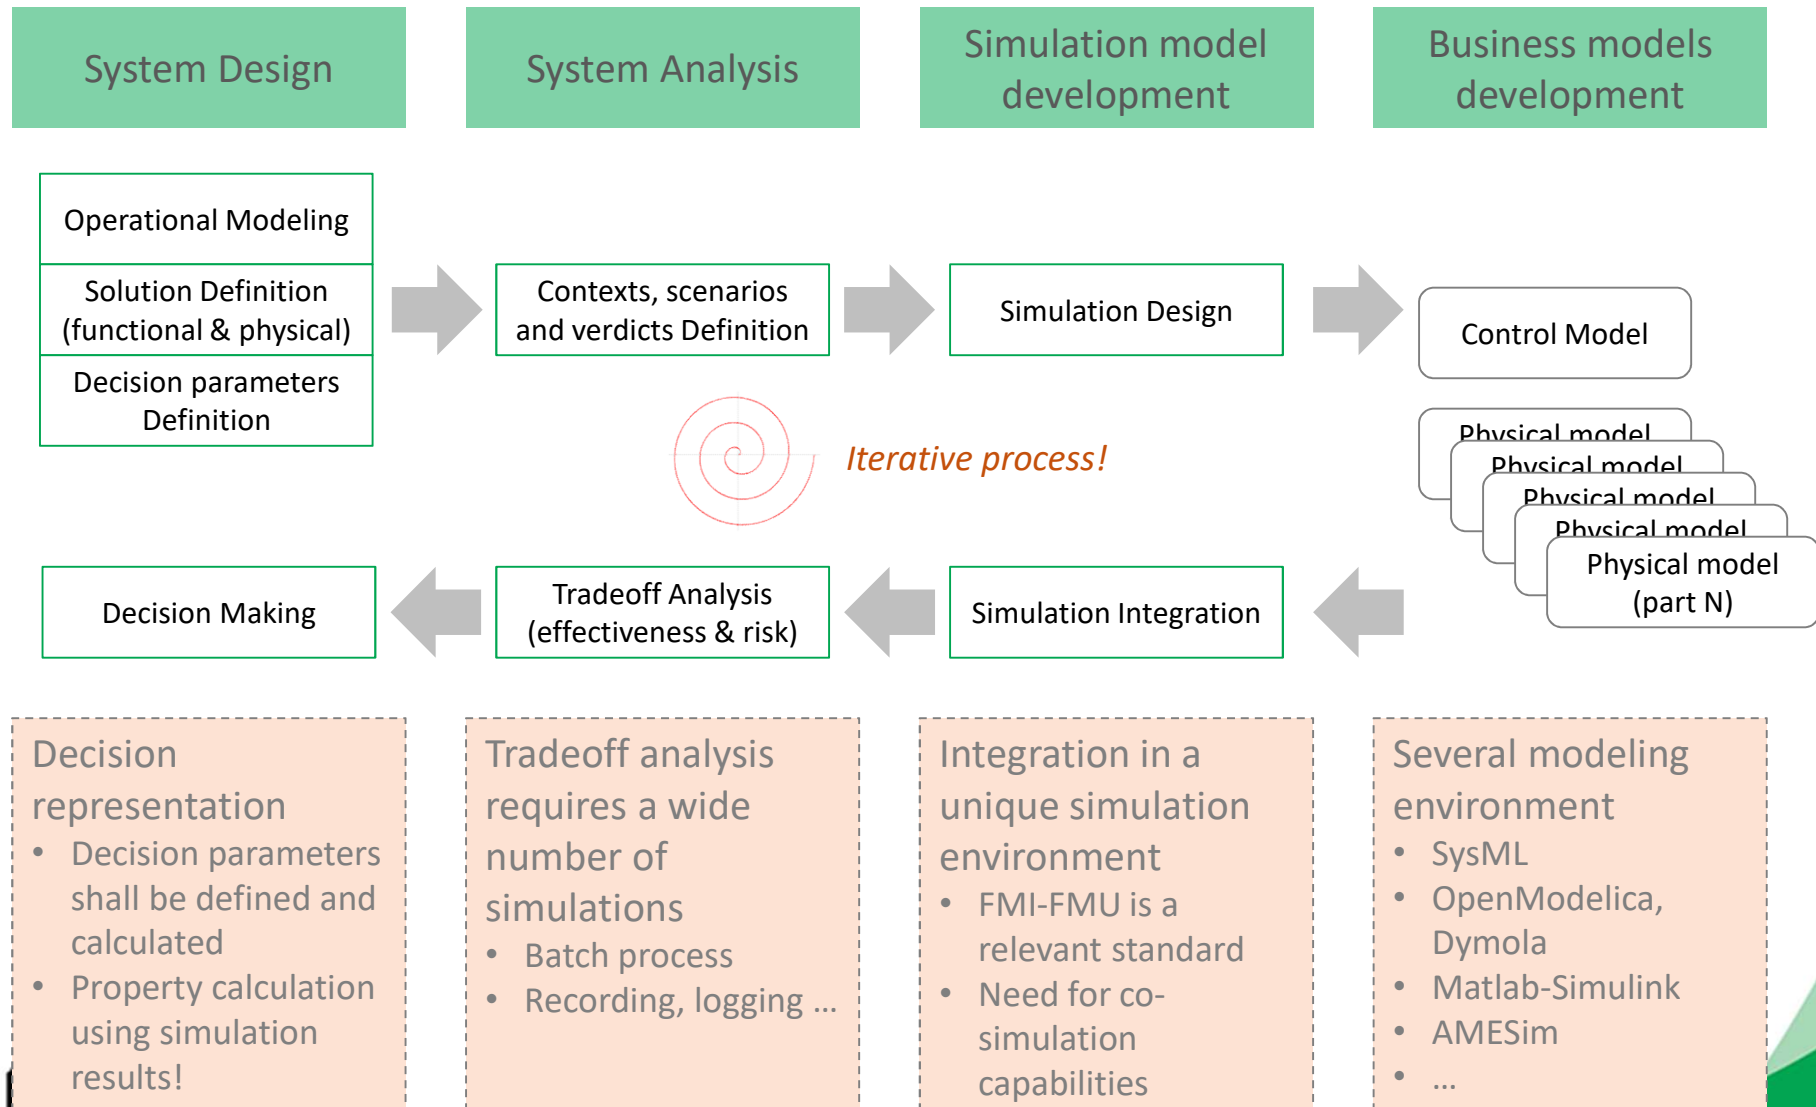

Plug-in Hybrid Electric Vehicle (PHEV)

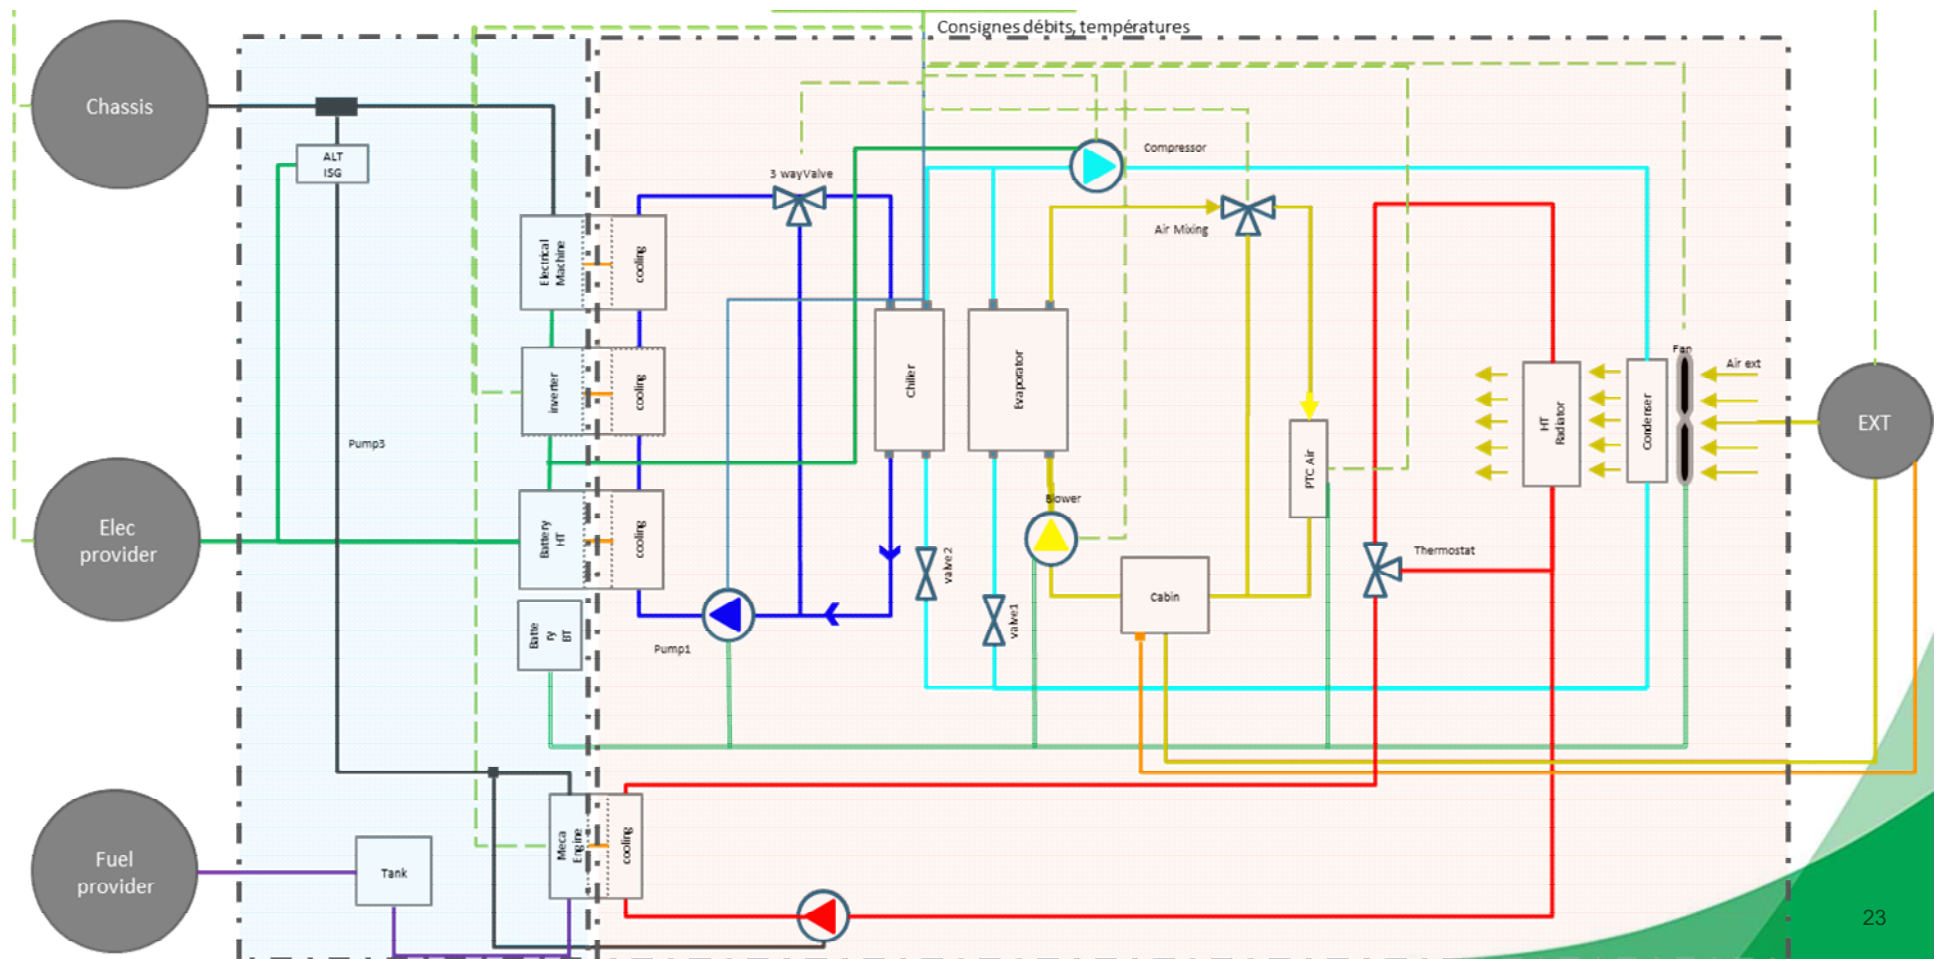

Energy and resource optimization

Processes for System Design and Analysis

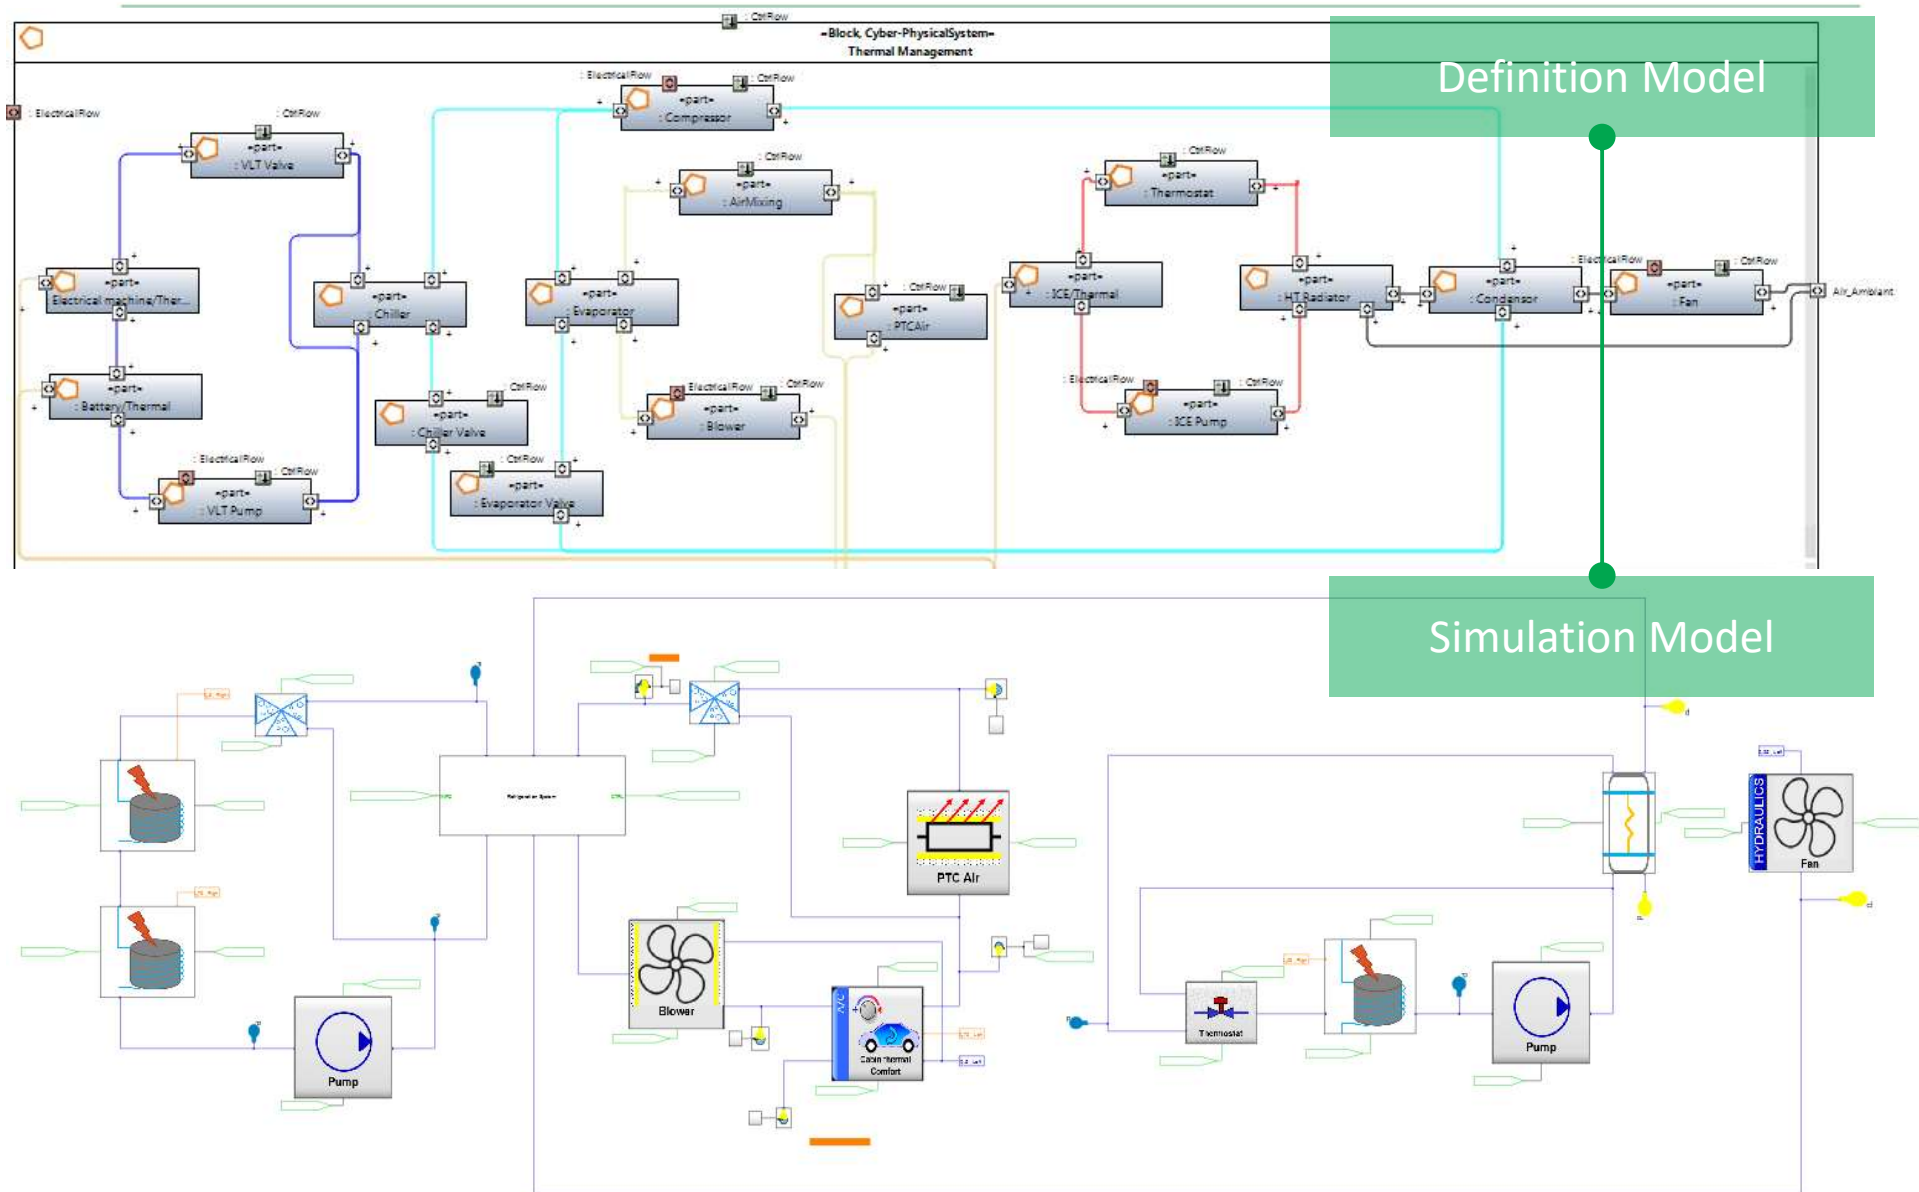

Thermal management modelling

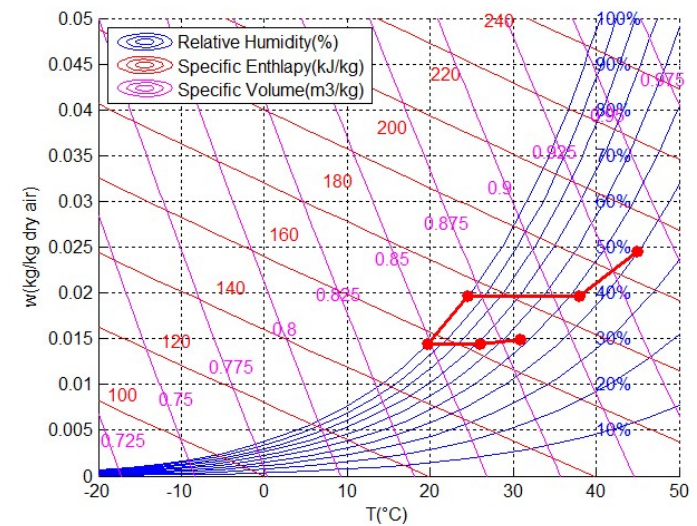

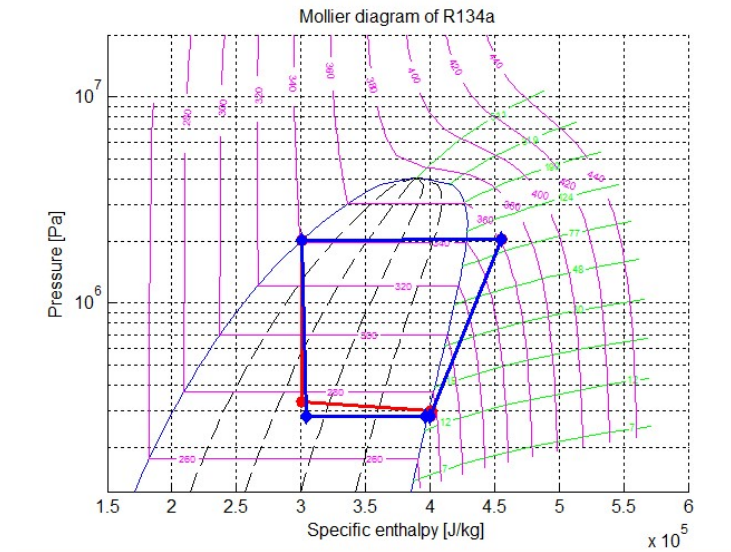

Modelling and control of the thermal part of the vehicle
Equipment conditioning (battery, e-machine, engine) + Cabin comfort + Management

Thermal management modelling

Thermal management: simulation results

Conclusion

- Industry grade benchmark models developed
- Supporting both early and later phase simulation scenarios based on FMI integration
- Prototype implementations for real-time synchronization and clocked synchronous library
- Development/adaptation of the distributed TLM (Transmission Line Method) simulation algorithms
