

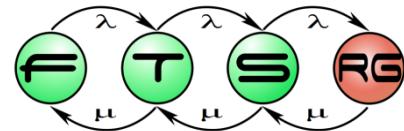

Graphical Editor Development

GEF, GMF, Graphiti

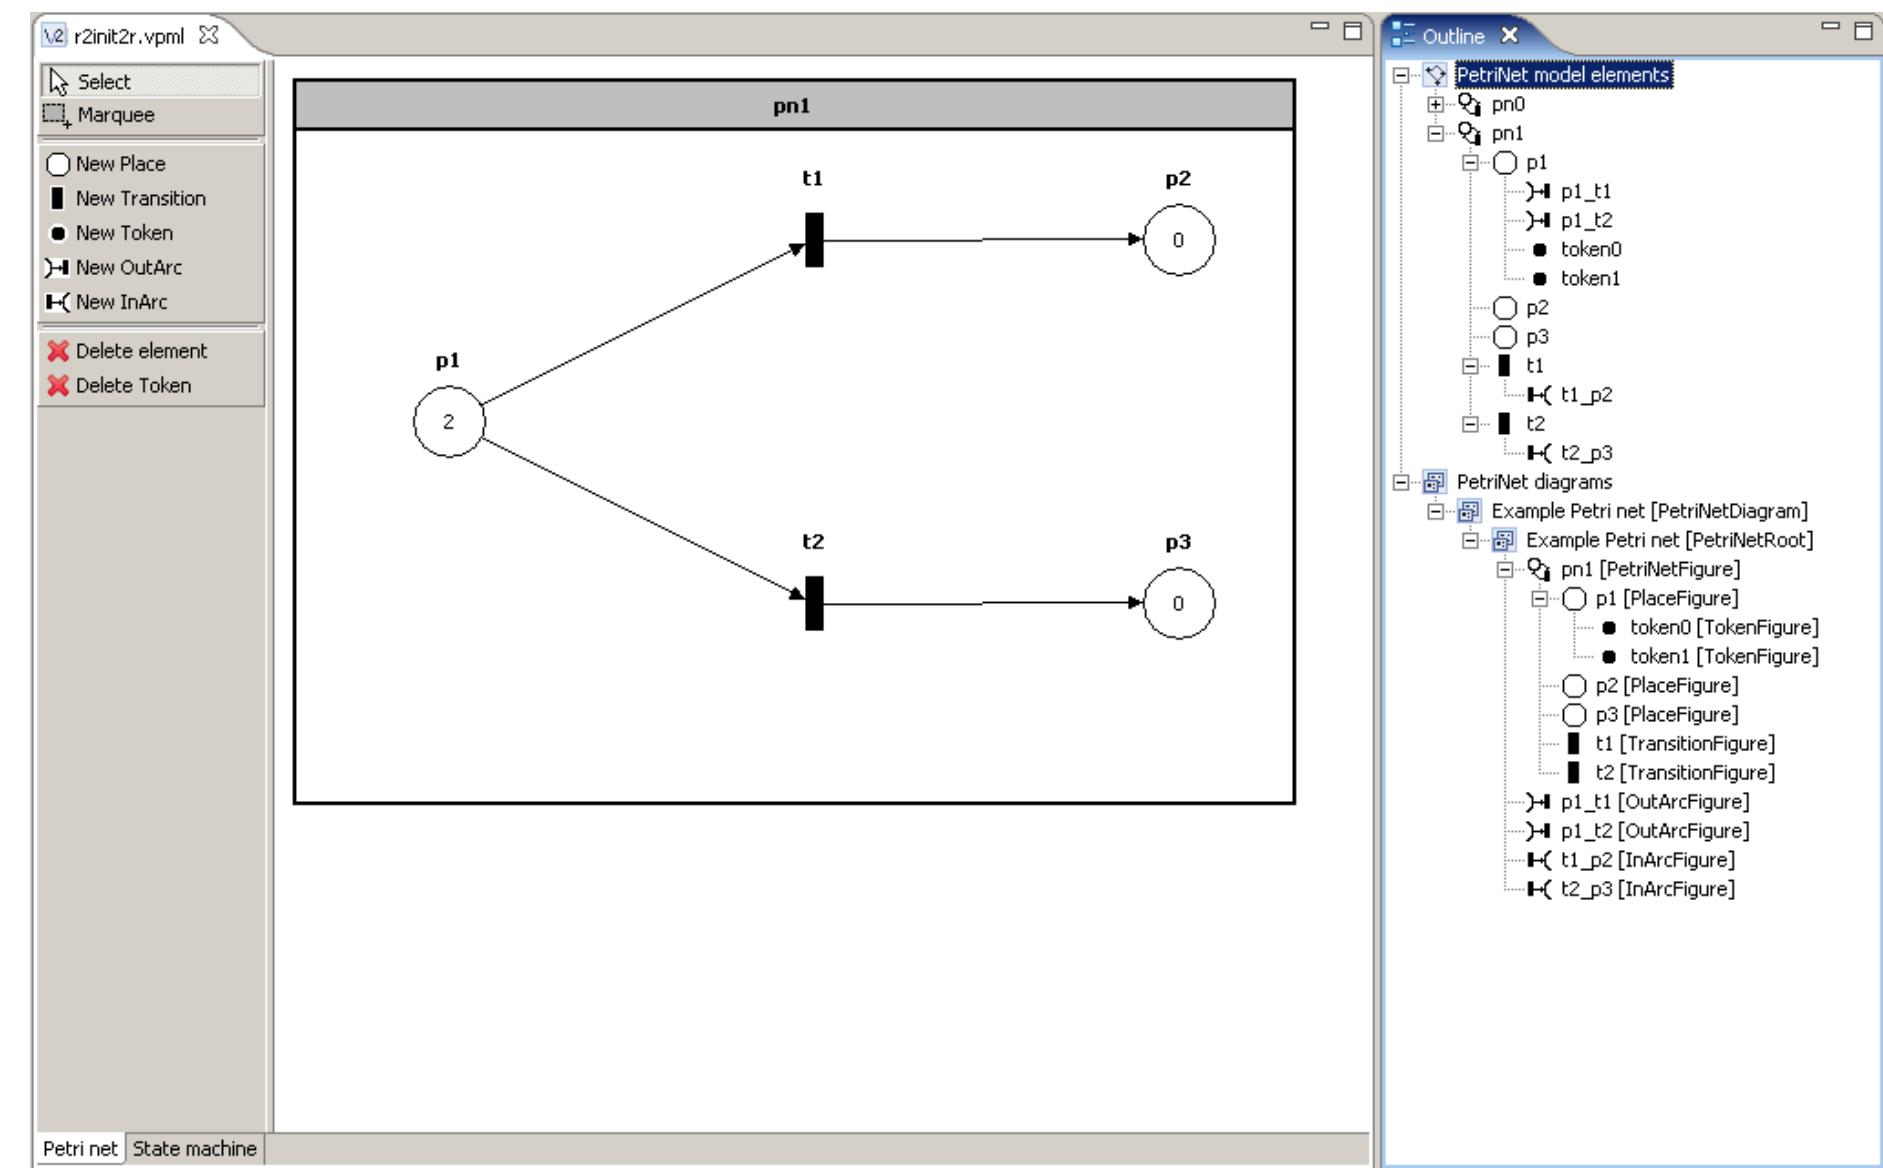

Designing modeling languages

- Metamodel: a model of models
 - Abstract syntax
 - **Concrete syntax**
 - Well-formedness rules
 - Behavioral (dynamic) semantics
 - Translation to other languages

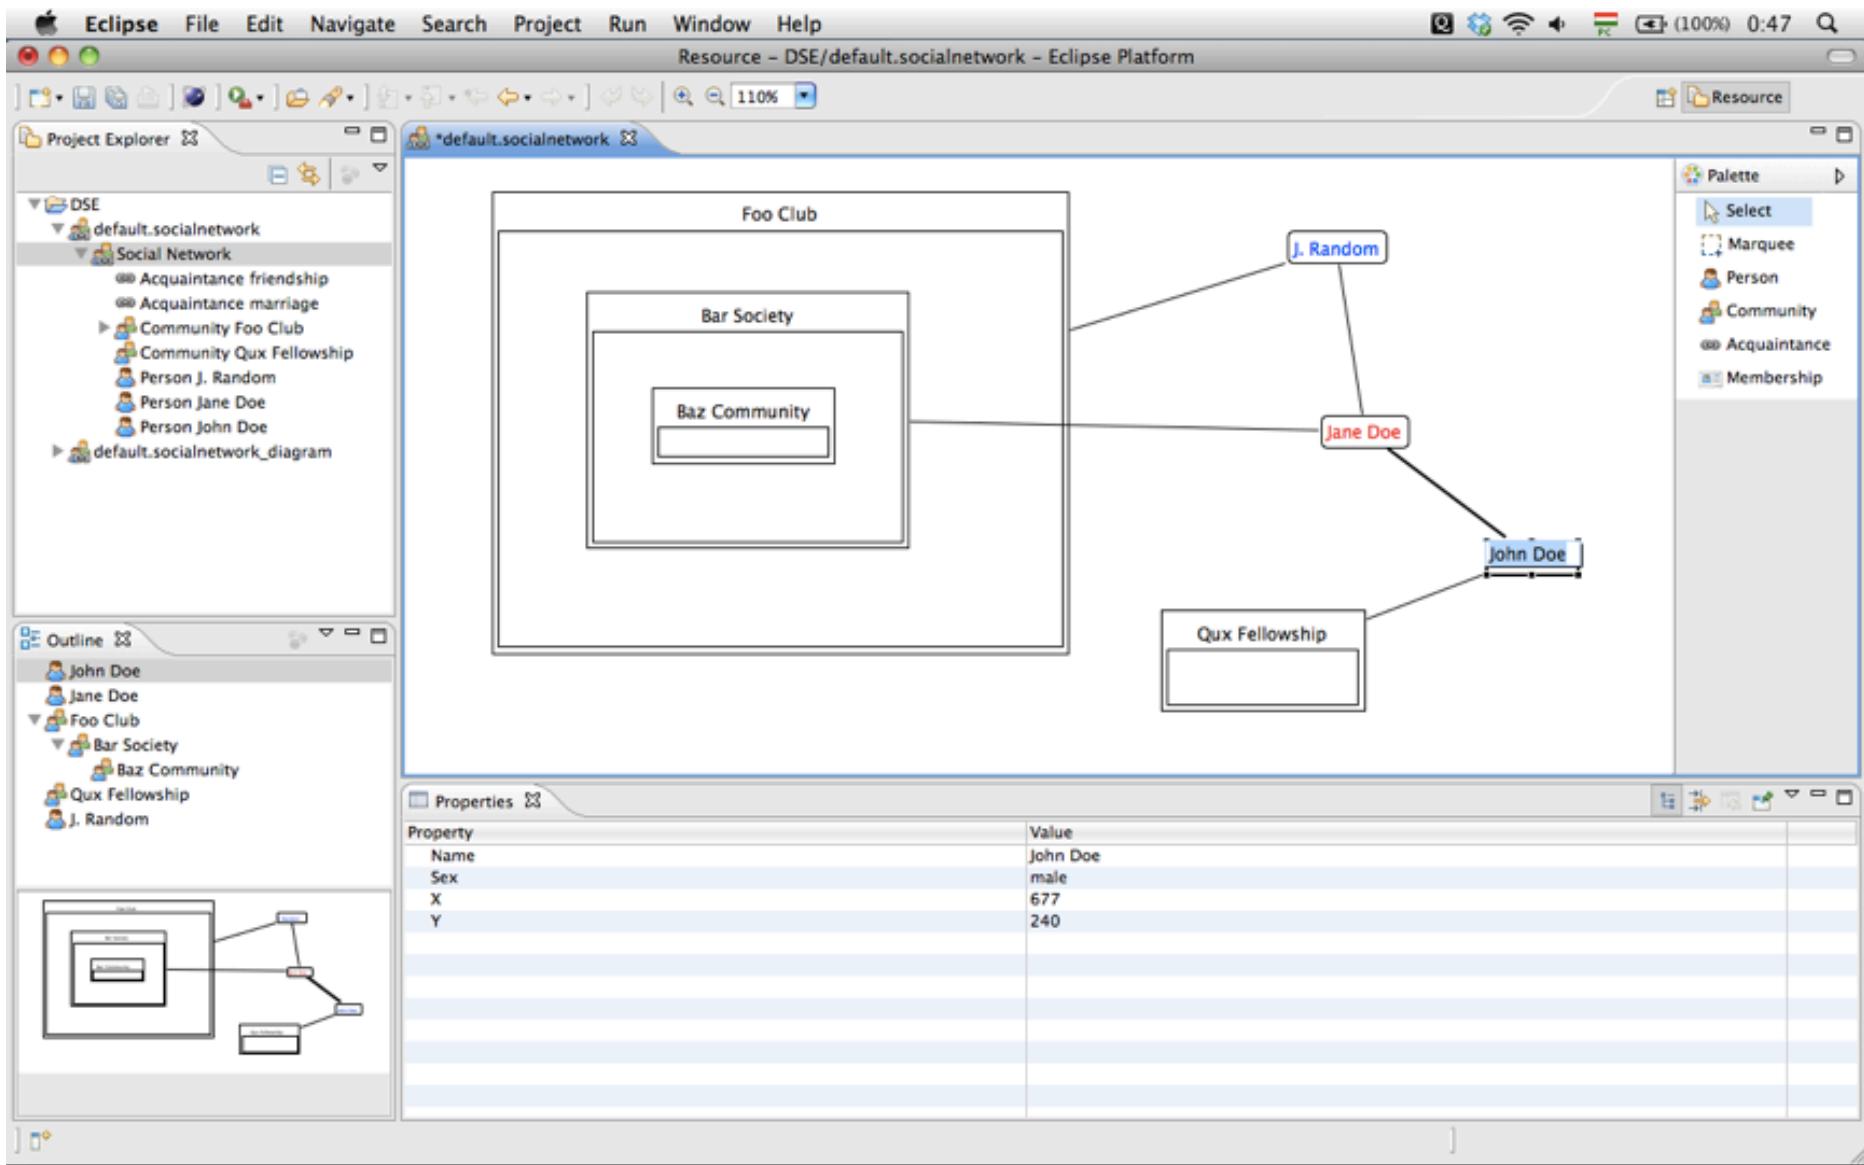

Goal of GEF

- Graphical editors
- Eclipse integration
- Model technology independent
 - Requires change notification support!
- Increased abstraction level
 - Wrt platform

Sample Graphical Editor: Petri net

Social Network example

More complex example: Sheet music

The screenshot shows a window titled "Kottaszerkesztő" (Score Editor) with a musical staff. The staff begins with a treble clef, a key signature of one sharp, and a tempo marking of "Allegro (♩=120)". A dynamic marking "mf" is placed near the beginning of the staff. The staff contains several eighth and sixteenth note patterns. To the left of the main window is a palette with various musical symbols under categories like "Hang" (Notes), "Szünet" (Rests), "Szólam" (Text/Brackets), and "Kulcs" (Key signatures). On the far left, there is a "Properties" panel with a table of properties and their values, and a "Szólamok" (Text) panel at the top.

Model-View-Controller (MVC) architecture

- Separate data and presentation
 - Model: stores data
 - View: displays data
 - Controller: user interaction support

MVC in GEF

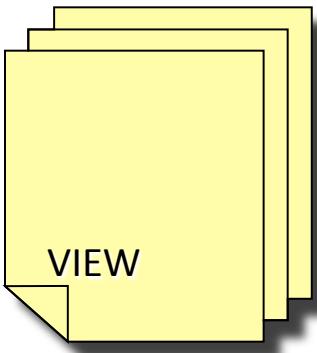

User

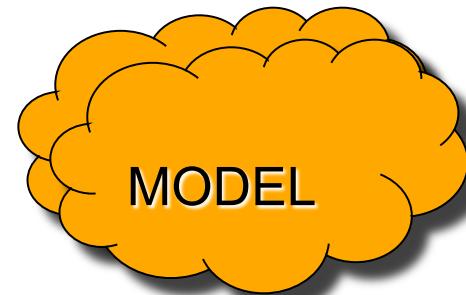

CONTROLLER

VIEW

MODEL

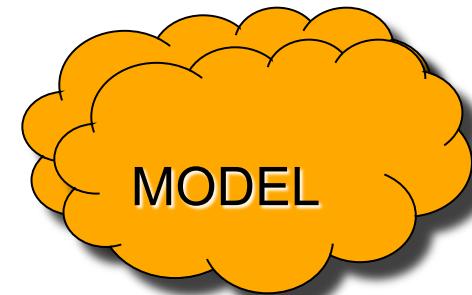

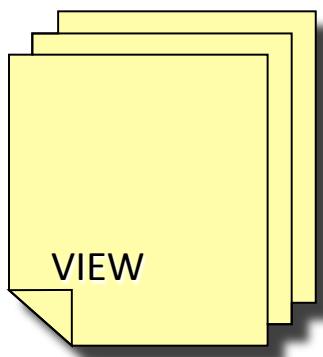

MVC in GEF

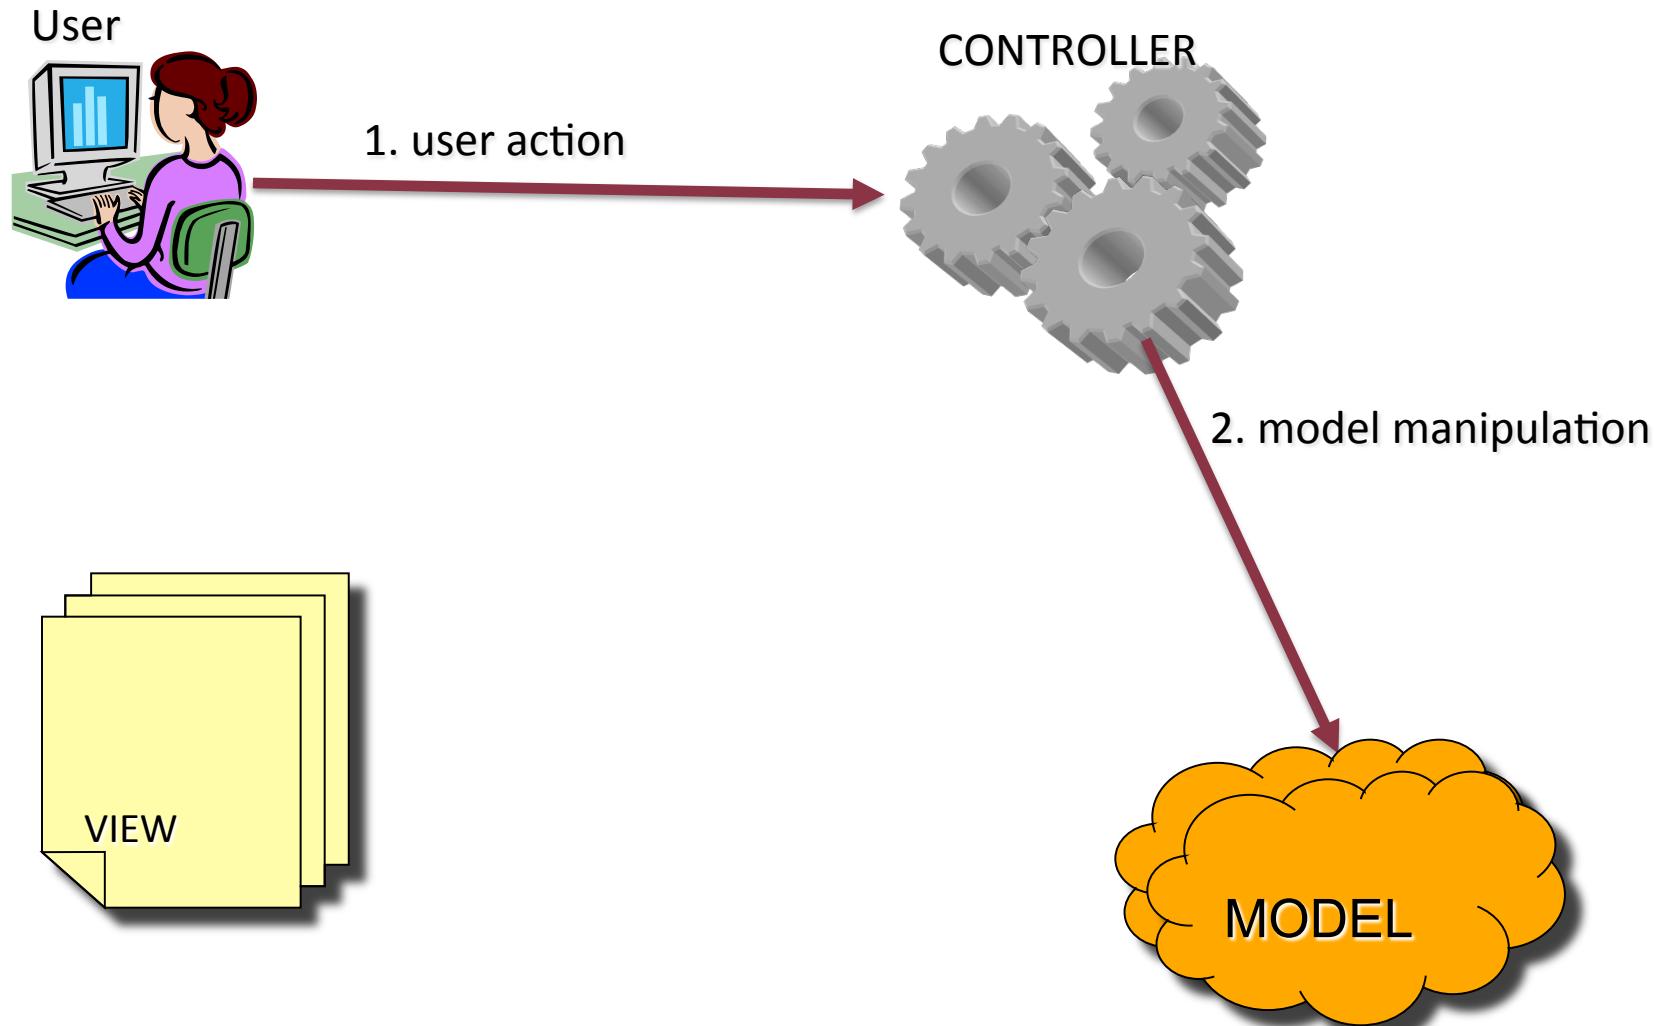

1. user action

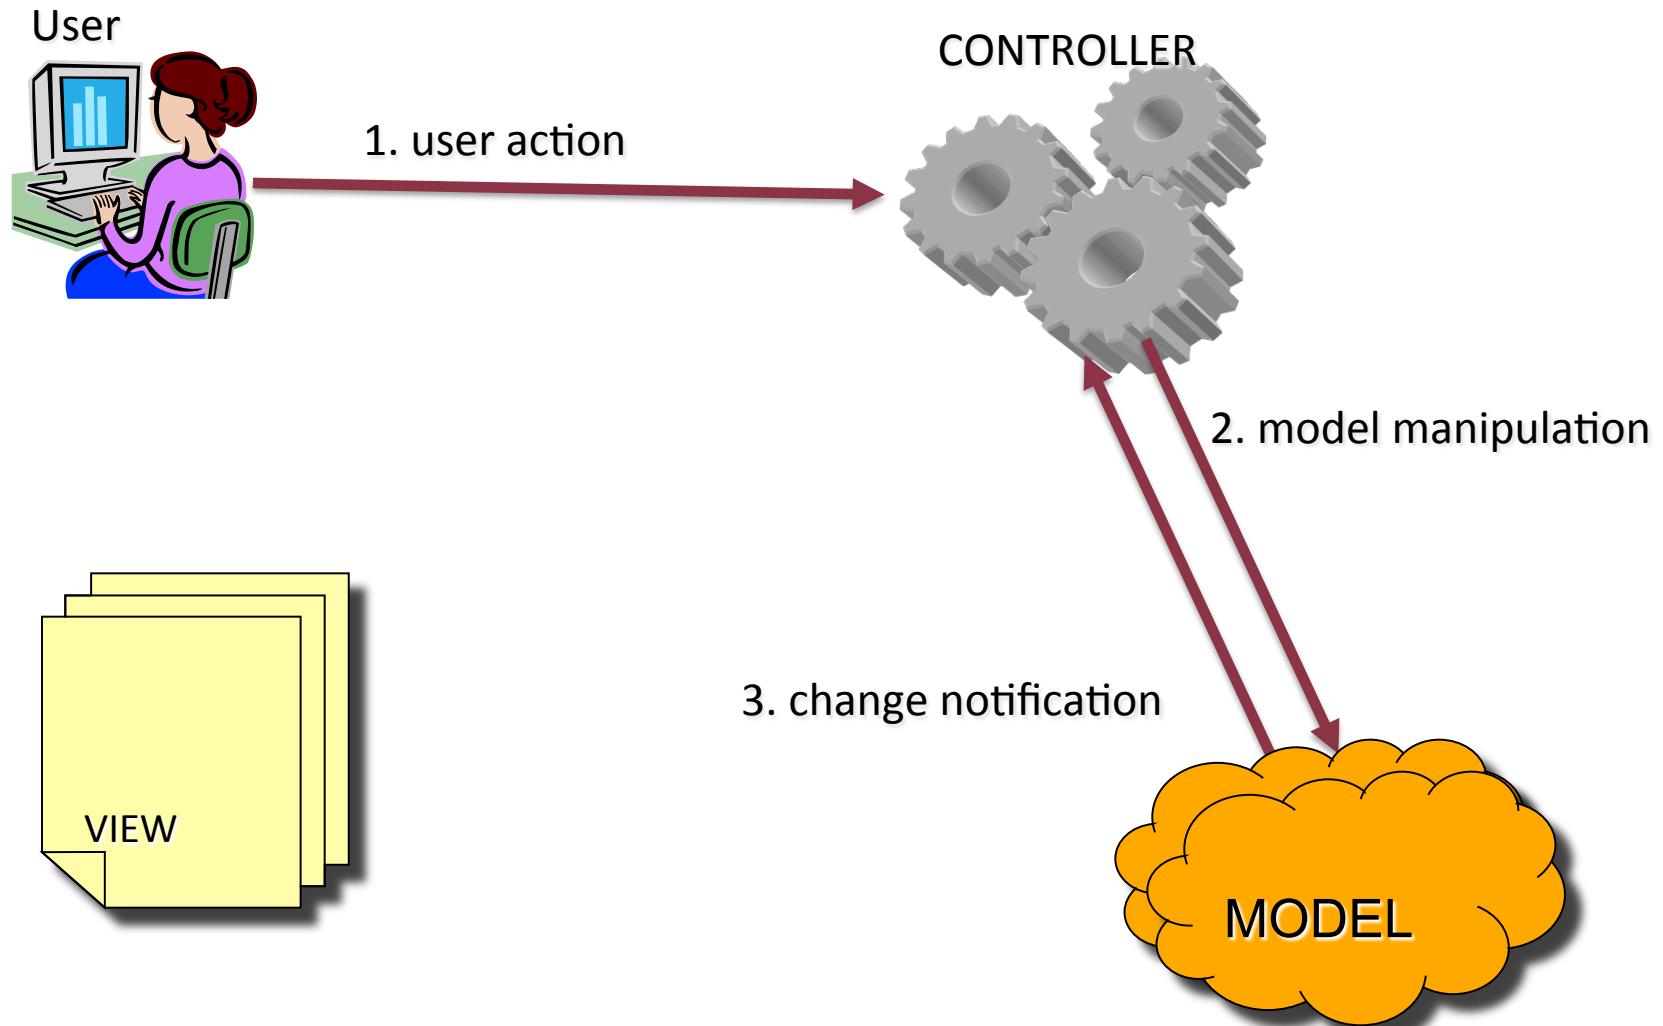

CONTROLLER

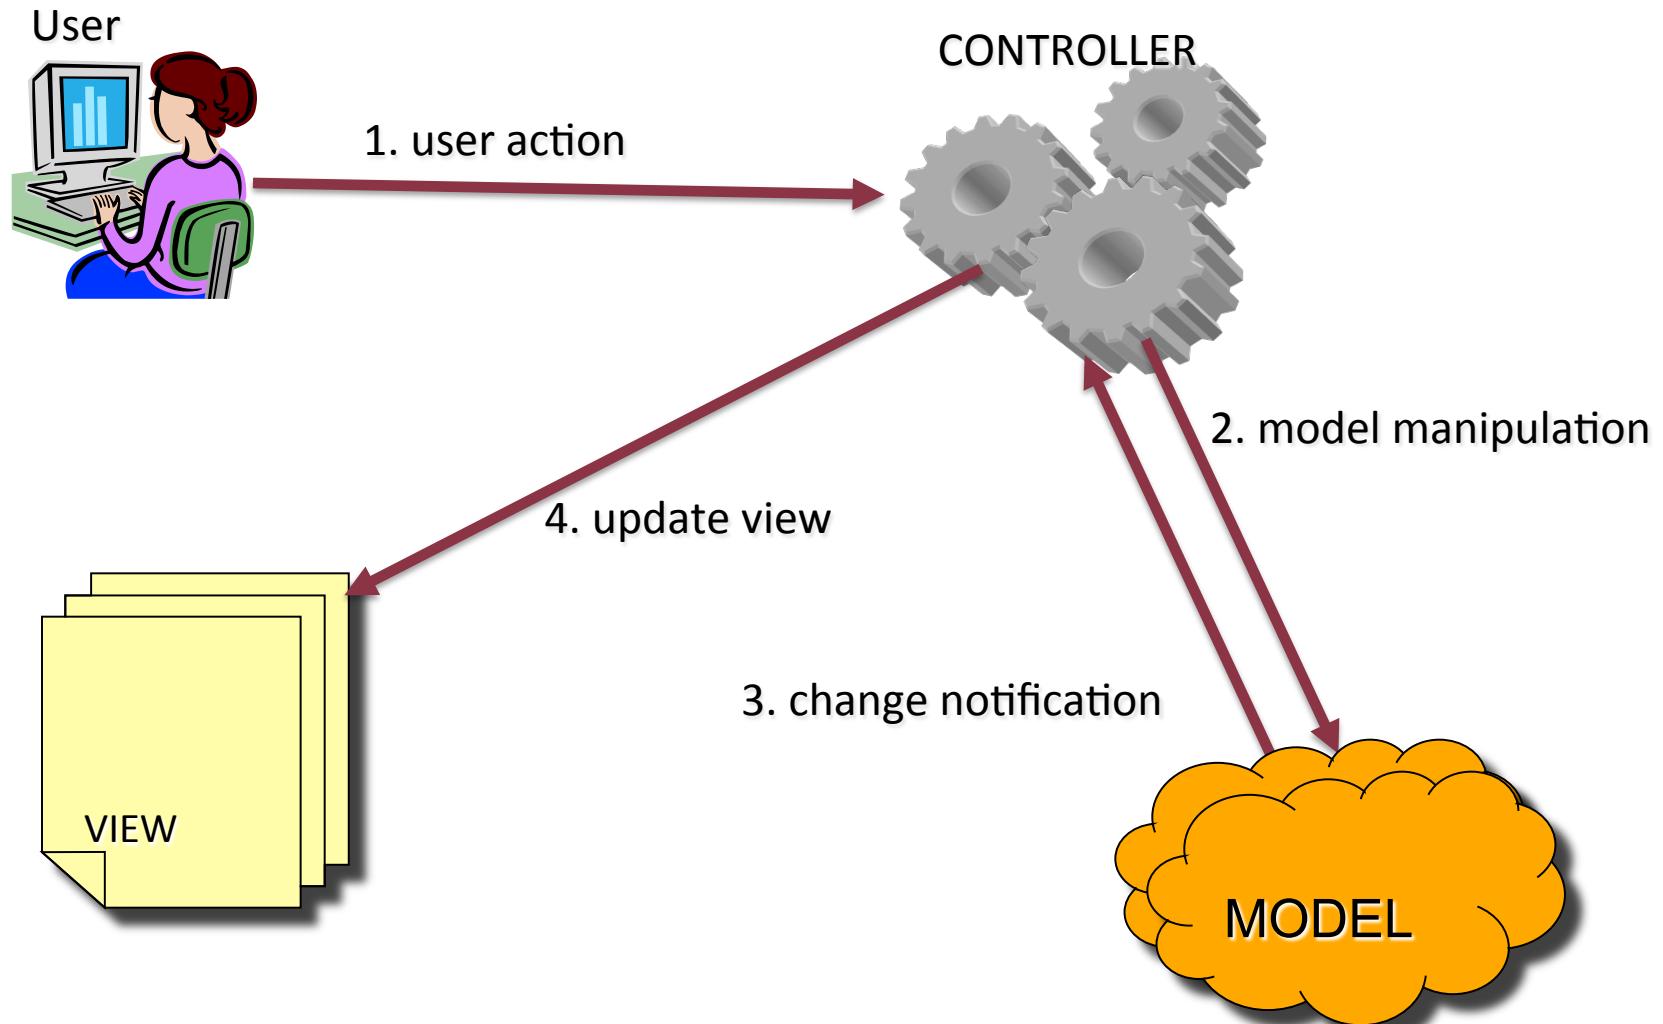

MVC in GEF

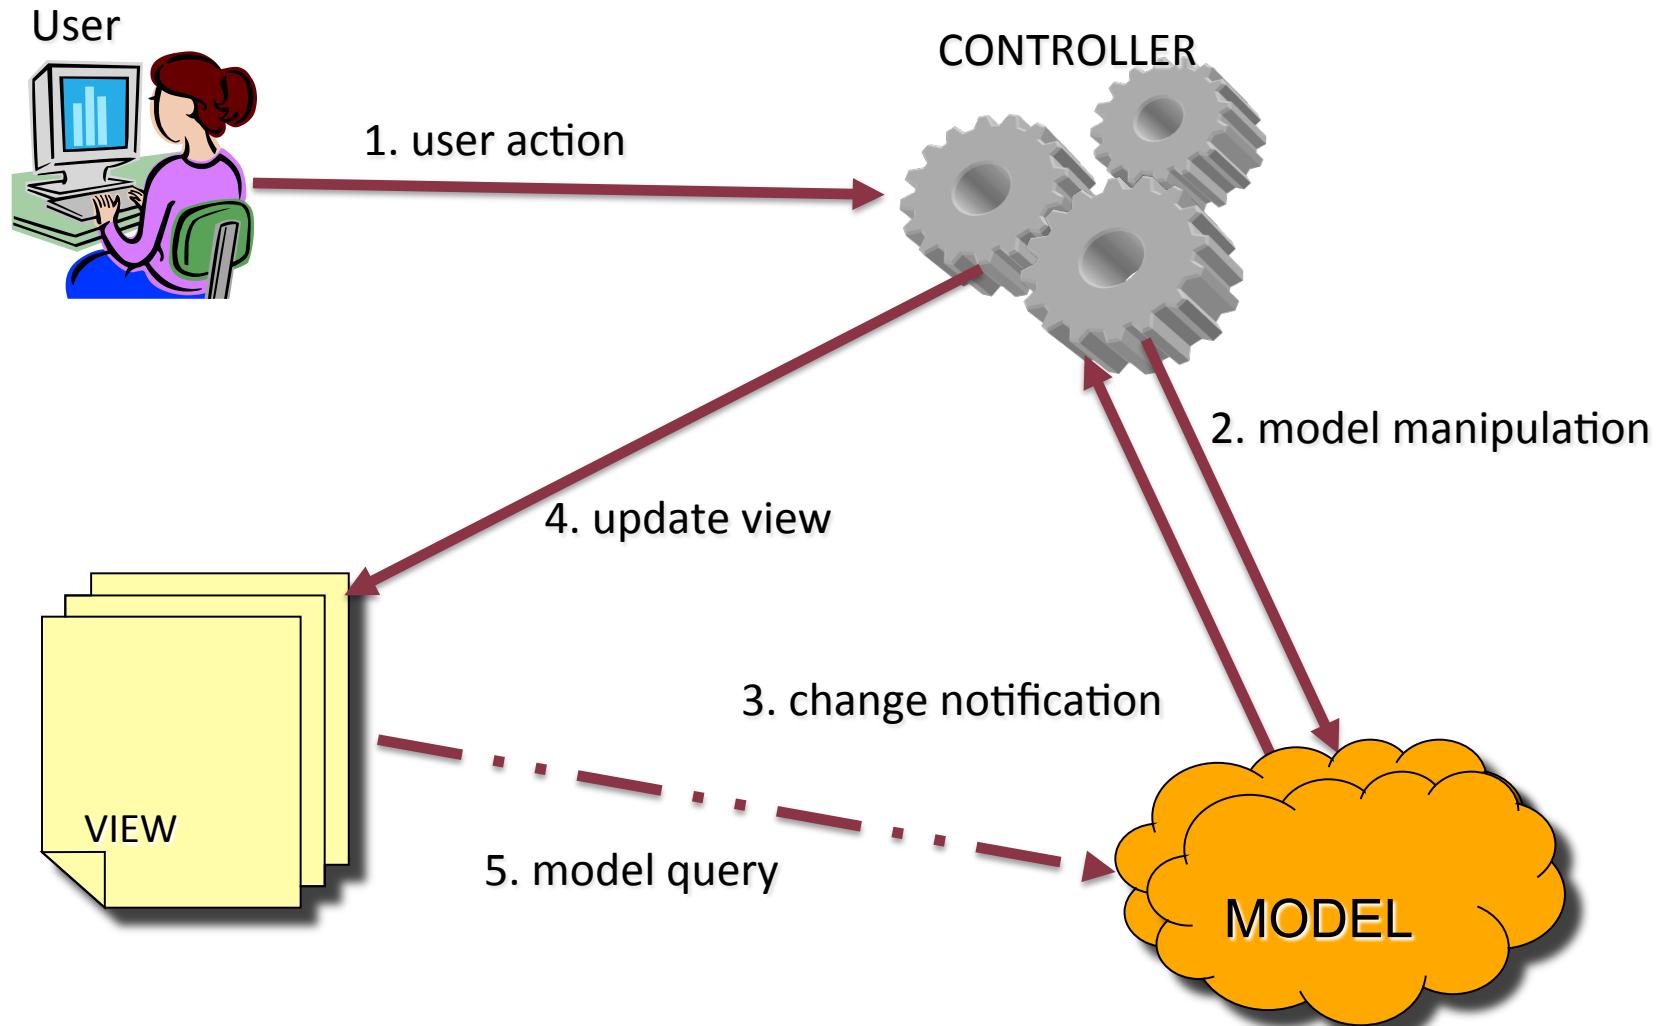

MVC in GEF

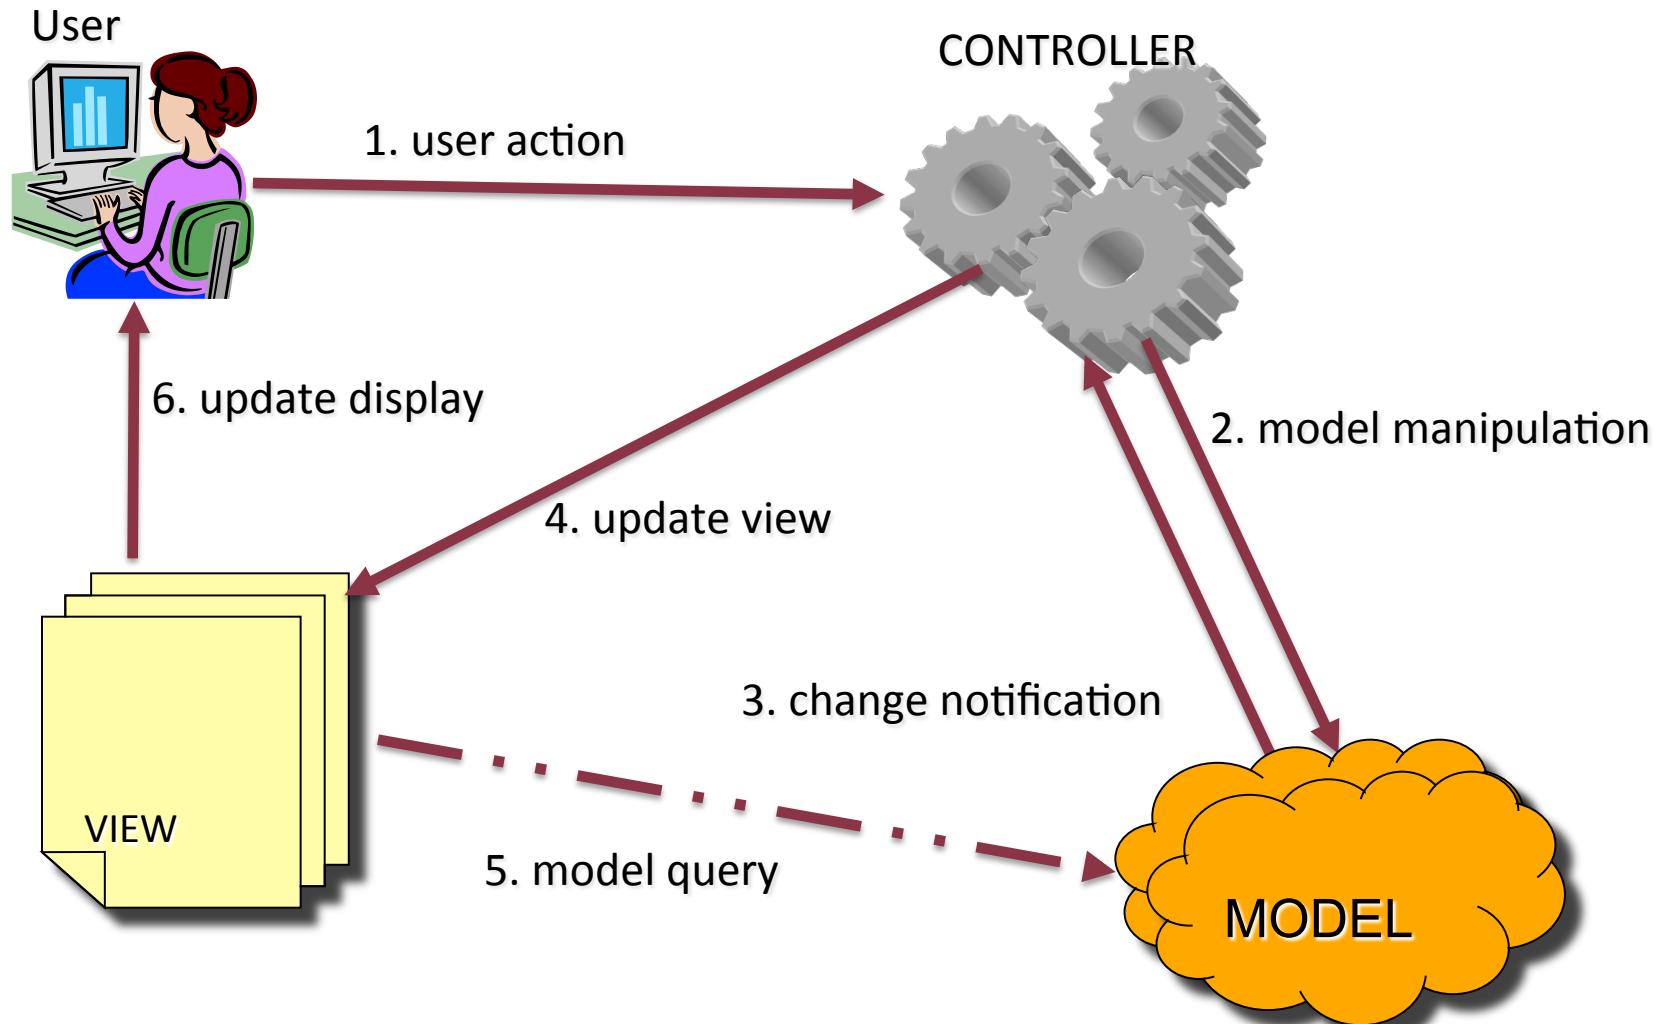

MVC in GEF

MVC in GEF

MVC in GEF

GEF workflow

Model

GEF workflow

Model

Notification

MVC in GEF: Model

- Arbitrary models supported
 - E.g., Java classes, EMF, database
 - Expect hierarchic storage (tree)
 - Notification support required
 - Notifies controller in case of changes
 - Critical if multiple views are present over the same model
 - EMF Notifications are useable
 - Business model
 - Structure, data
 - View model
 - Display information
 - E.g., position, size, color, ...

GEF workflow

Model

View

GEF workflow

Model

View

Drawing

GEF workflow

Model

View

Drawing

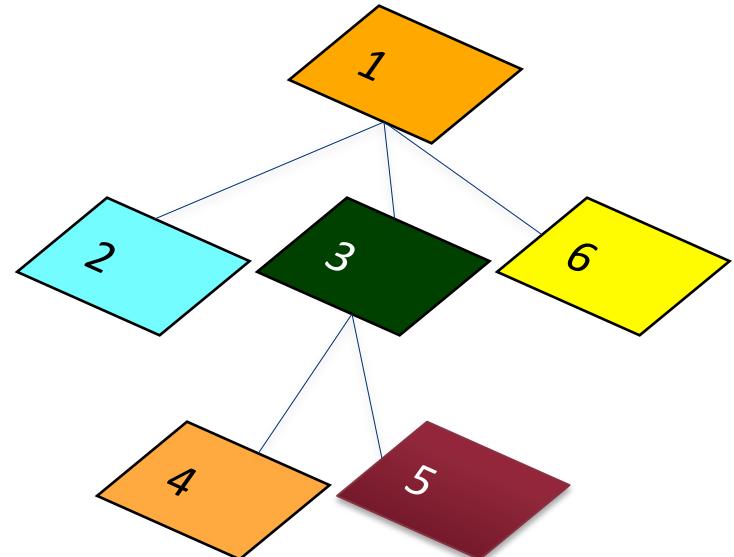

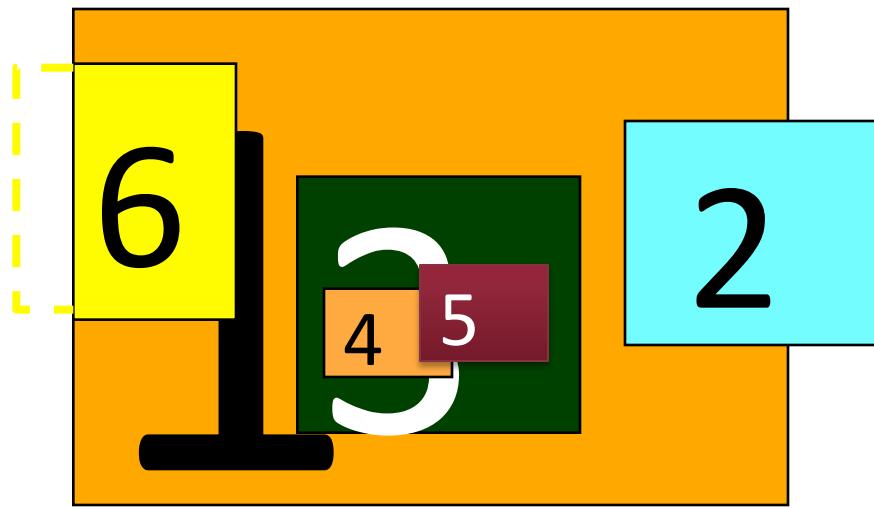

Layouting

MVC in GEF: View

- View: Draw2D Figures
 - Vector graphic library over SWT
 - Predefined simple elements
 - Label
 - Rectangle
 - Connector (arrow)
 - Hierarchic display
 - Basic component: Figure
- GEF views are implemented by
 - Draw2D Figure instances

Draw2D hierarchy

- Child position is relative to its parent
 - Negative coordinates (left, top) trimmed!
- Exactly one root element

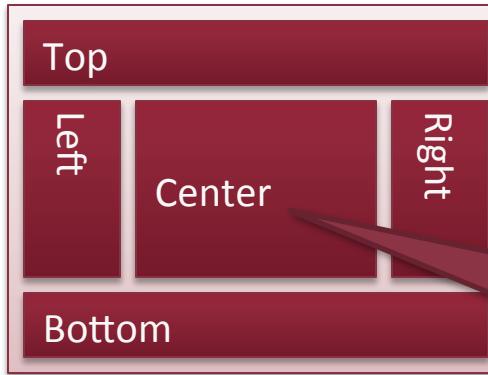

Draw2D LayoutManager

- Organizes children of a Figure
- Multiple implementations available, extensible
- Constraint: how to position children
 - Container position and size + LayoutManager + Constraint
 - Child position and size
 - Constraints are attached to children
 - Parent LayoutManager **may** consider constraints

Draw2D LayoutManagers

BorderLayout

FlowLayout

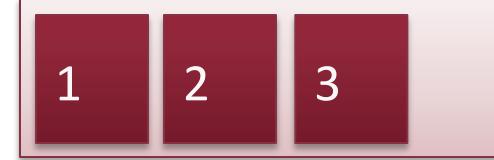

Constraints

XYLayout

ToolbarLayout

Draw2D elements

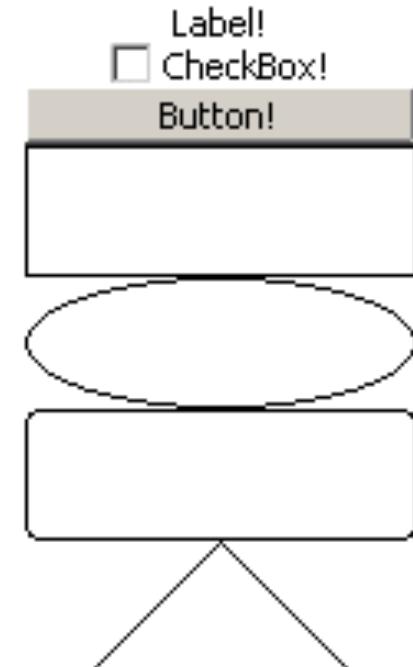

- Simple elements
 - Label, Button, CheckBox, Image
- Geometric shapes
 - RectangleFigure, Ellipse, Triangle
- Panel: generic container element
- ScrollPane: scrollable container element

Draw2D other elements

- Arrows
- Borders
- Custom figures
 - Sometimes combining existing elements is not enough
 - `paintFigure()` method can be redefined
 - SWT-based drawing code can be used

Base elements - example

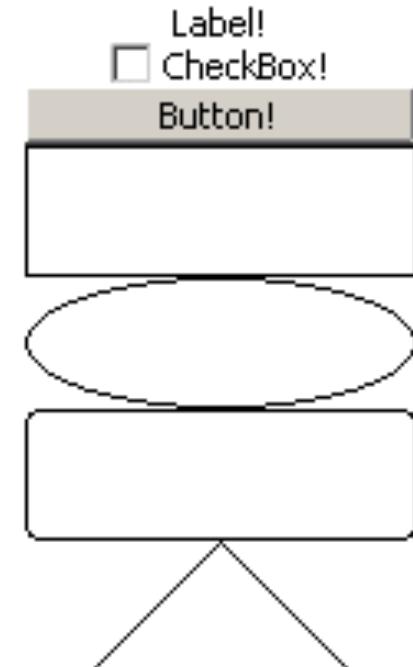

```
public class Peldal extends Figure {  
    public Peldal() {  
        setOpaque(true);  
        setBackgroundColor(ColorConstants.white);  
        setLayoutManager(new ToolbarLayout());  
        add(new Label("Label!"));  
        add(new CheckBox("CheckBox!"));  
        add(new Button("Button!"));  
        add(new RectangleFigure());  
        add(new Ellipse());  
        add(new RoundedRectangle());  
        add(new Triangle());  
        for (int i = 3; i <= 6; i++)  
            ((Figure) getChildren().get(i)).setPreferredSize(-1, 40);  
    }  
}
```

Base elements - example

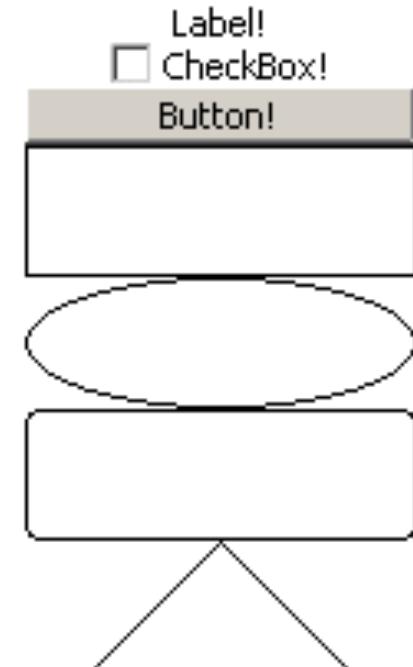

```
public class Peldal extends JPanel {  
    public Peldal() {  
        setOpaque(true);  
        setBackgroundColor(ColorConstants.white);  
        setLayoutManager(new ToolbarLayout());  
        add(new Label("Label!"));  
        add(new CheckBox("CheckBox!"));  
        add(new Button("Button!"));  
        add(new RectangleFigure());  
        add(new Ellipse());  
        add(new RoundedRectangle());  
        add(new Triangle());  
        for (int i = 3; i <= 6; i++)  
            ((Figure) getChildren().get(i)).setPreferredSize(-1, 40);  
    }  
}
```

By default
everything is
transparent

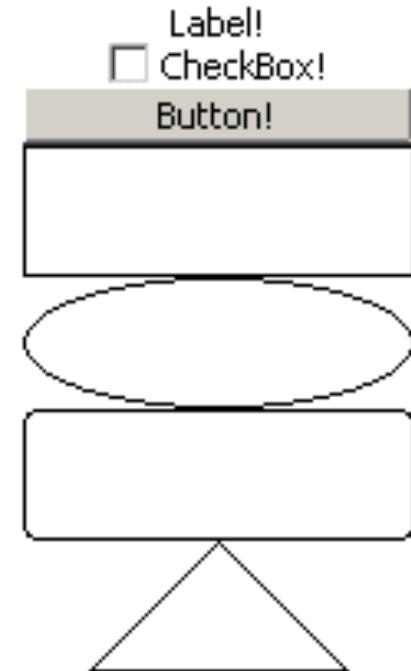

Base elements - example

```
public class Peldal extends Figure {  
    public Peldal() {  
        setOpaque(true);  
        setBackgroundColor(ColorConstants.white);  
        setLayoutManager(new ToolbarLayout());  
        add(new Label("Label!"));  
        add(new CheckBox("CheckBox!"));  
        add(new Button("Button!"));  
        add(new RectangleFigure());  
        add(new Ellipse());  
        add(new RoundedRectangle());  
        add(new Triangle());  
        for (int i = 3; i <= 6; i++)  
            ((Figure) getChildren().get(i)).setPreferredSize(-1, 40);  
    }  
}
```

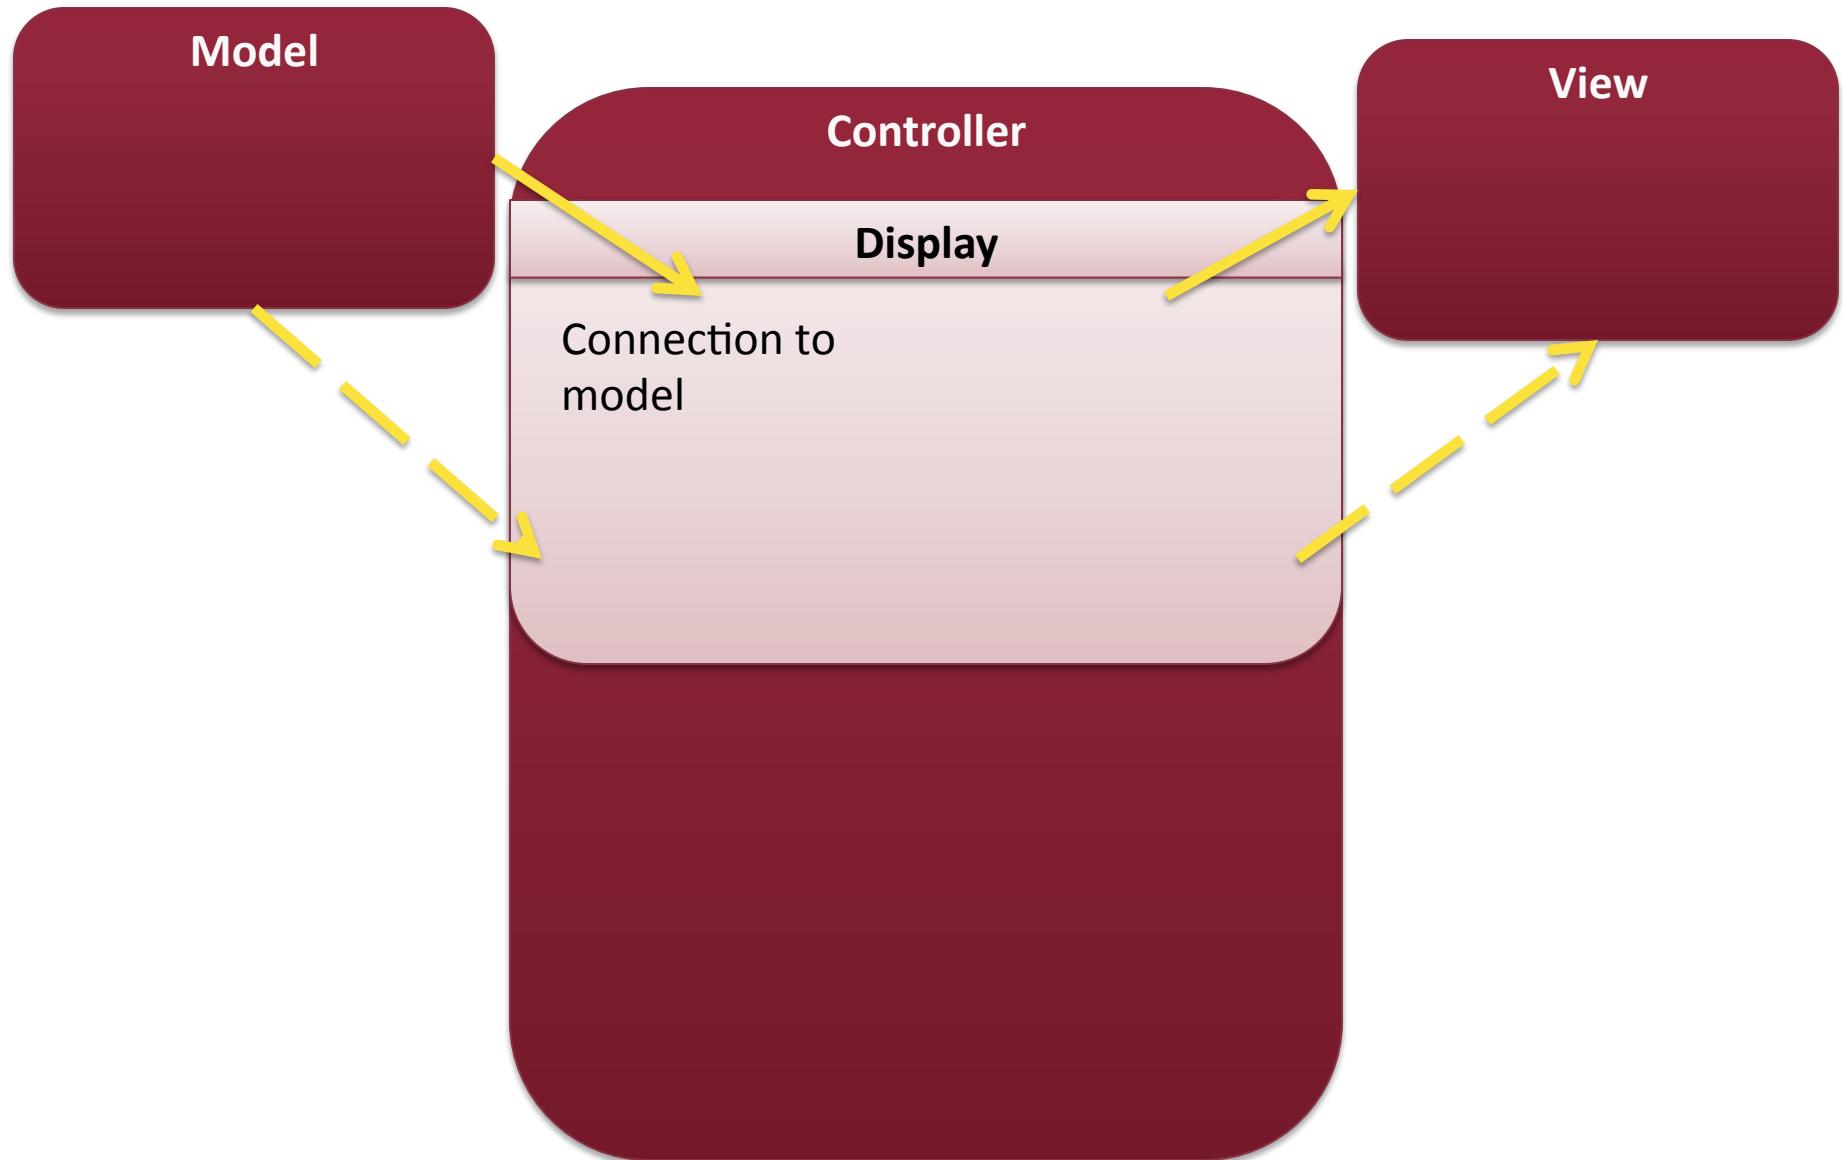

Base elements - example

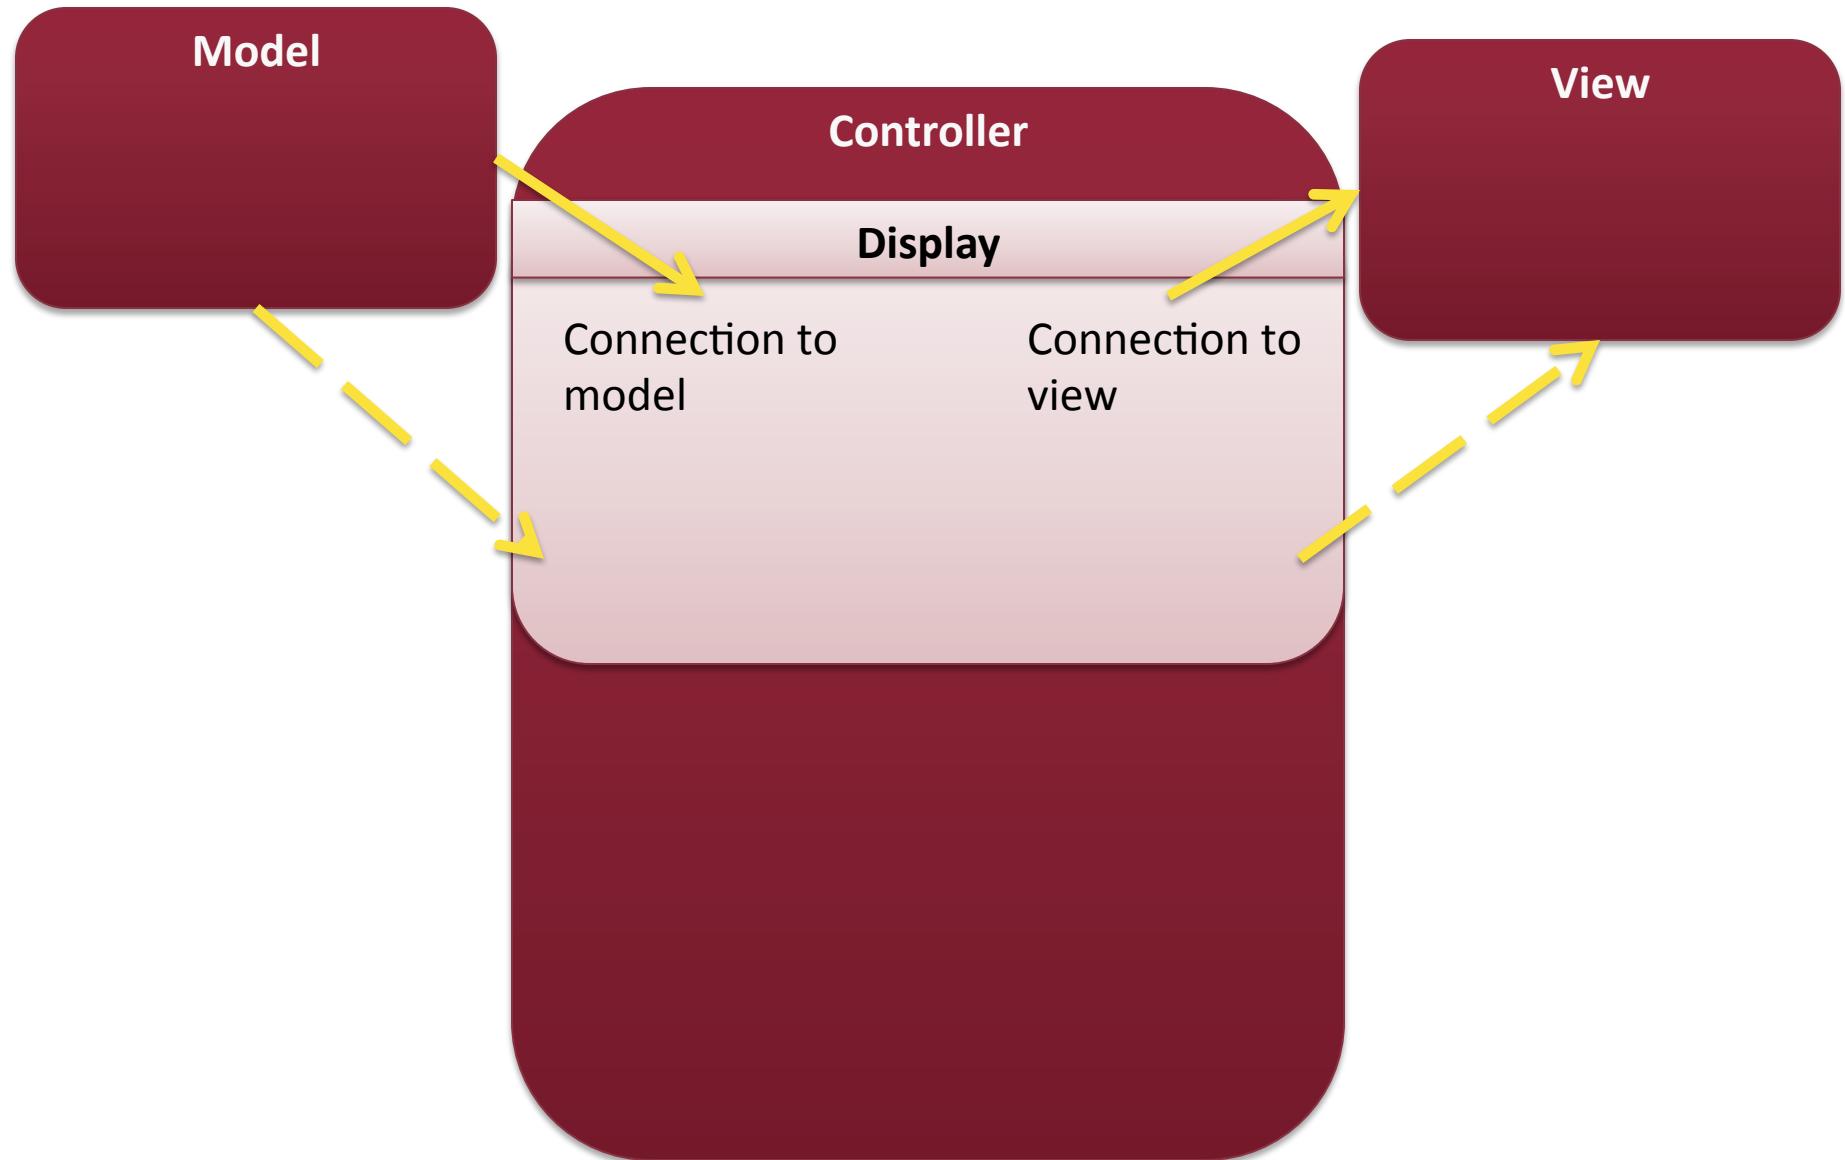

```
public class Peldal extends Figure {  
    public Peldal() {  
        setOpaque(true);  
        setBackgroundColor(ColorConstants.white);  
        setLayoutManager(new ToolbarLayout());  
        add(new Label("Label!"));  
        add(new CheckBox("CheckBox!"));  
        add(new Button("Button!"));  
        add(new RectangleFigure());  
        add(new Ellipse());  
        add(new RoundedRectangle());  
        add(new Triangle());  
        for (int i = 3; i <= 6; i++)  
            ((Figure) getChildren().get(i)).setPreferredSize(-1, 40);  
    }  
}  
} Preferred size constraint
```

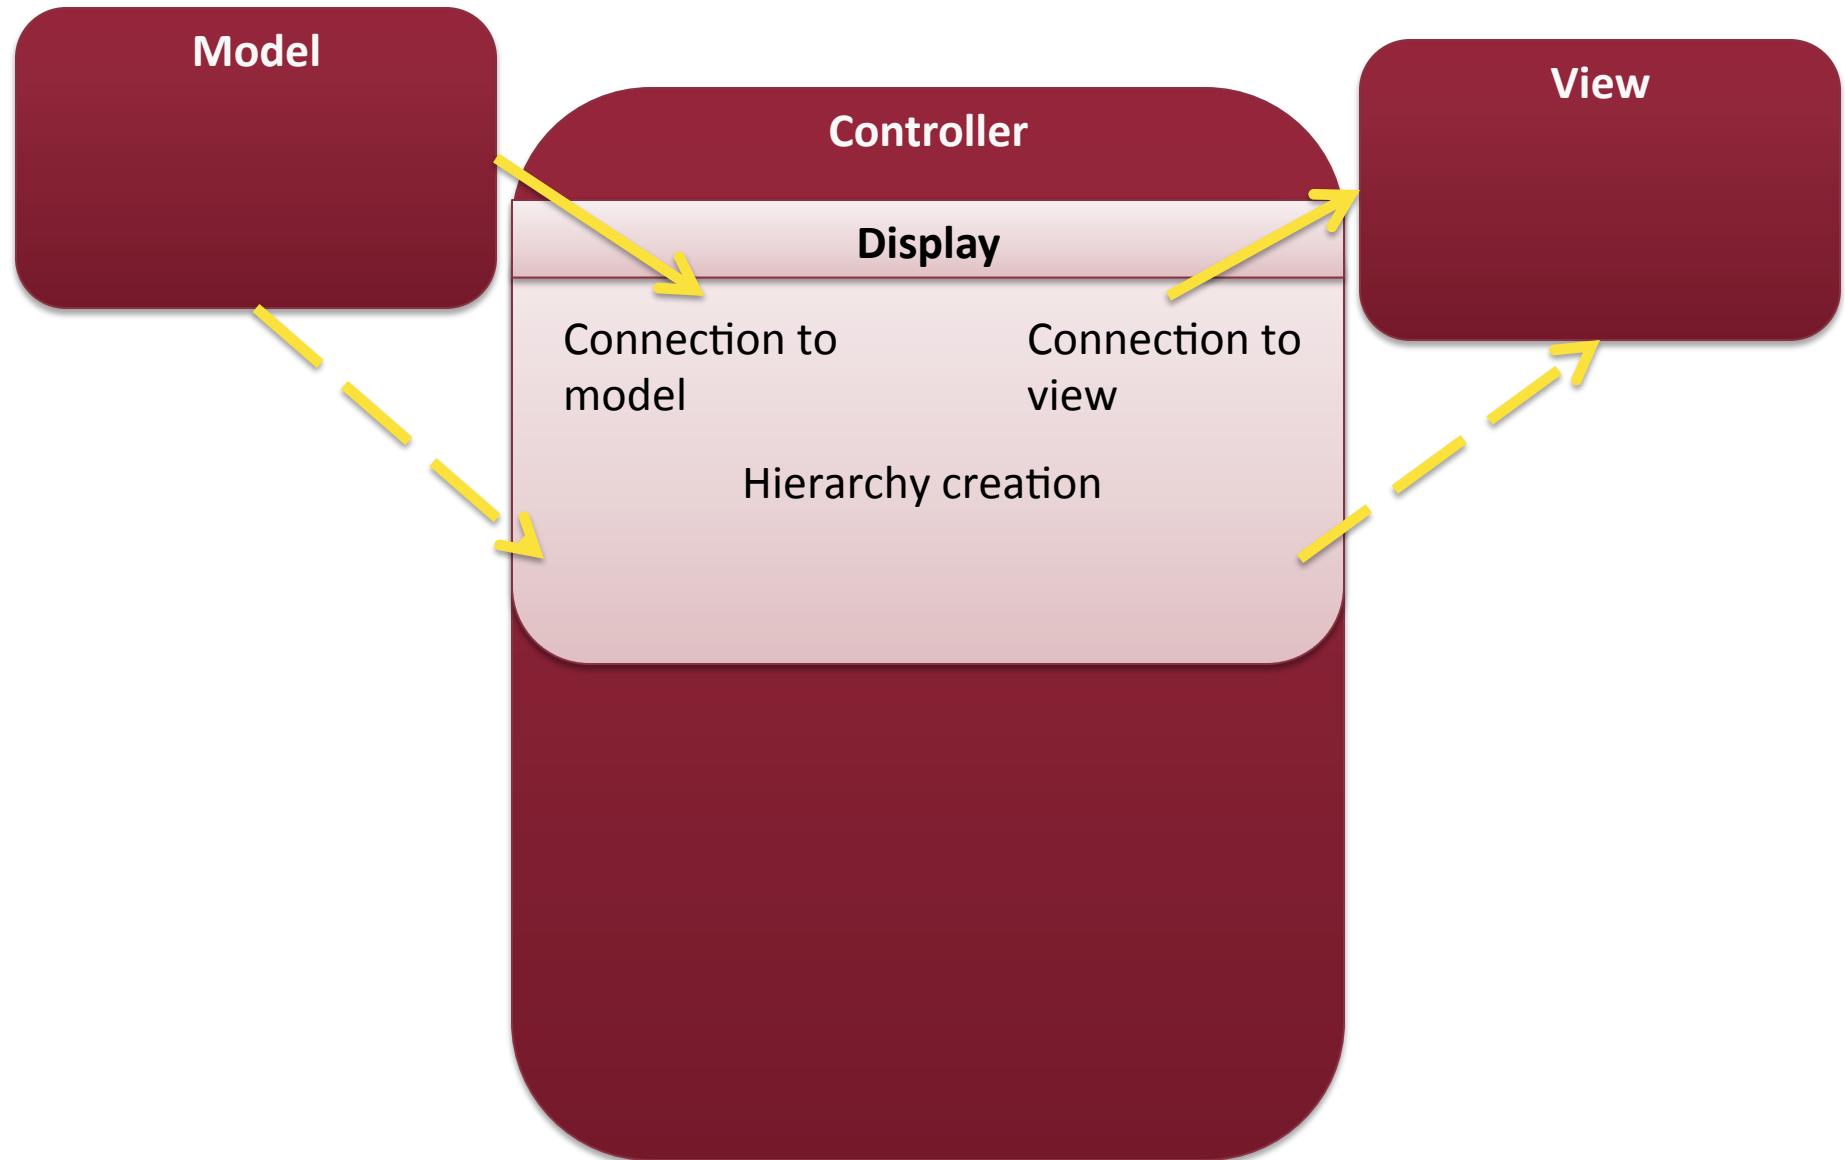

GEF workflow

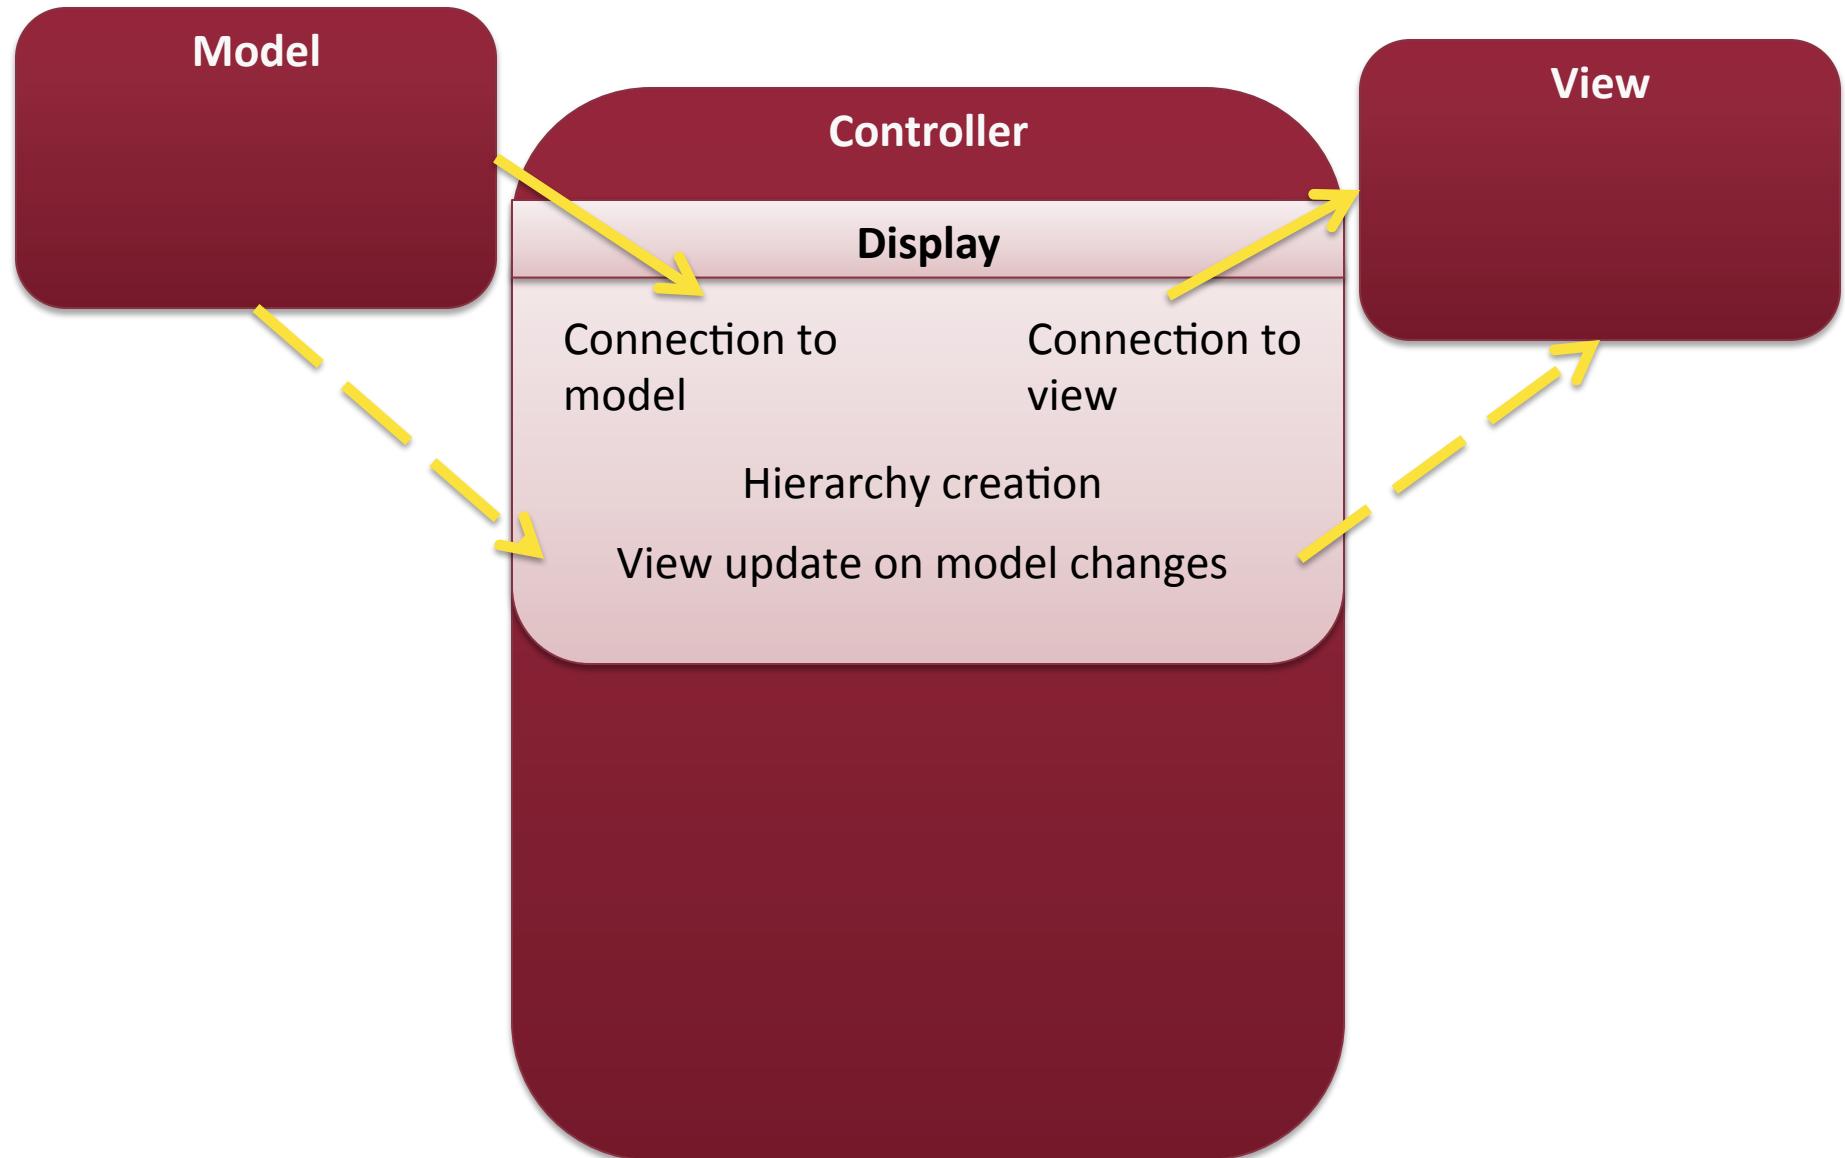

GEF workflow

GEF workflow

GEF workflow

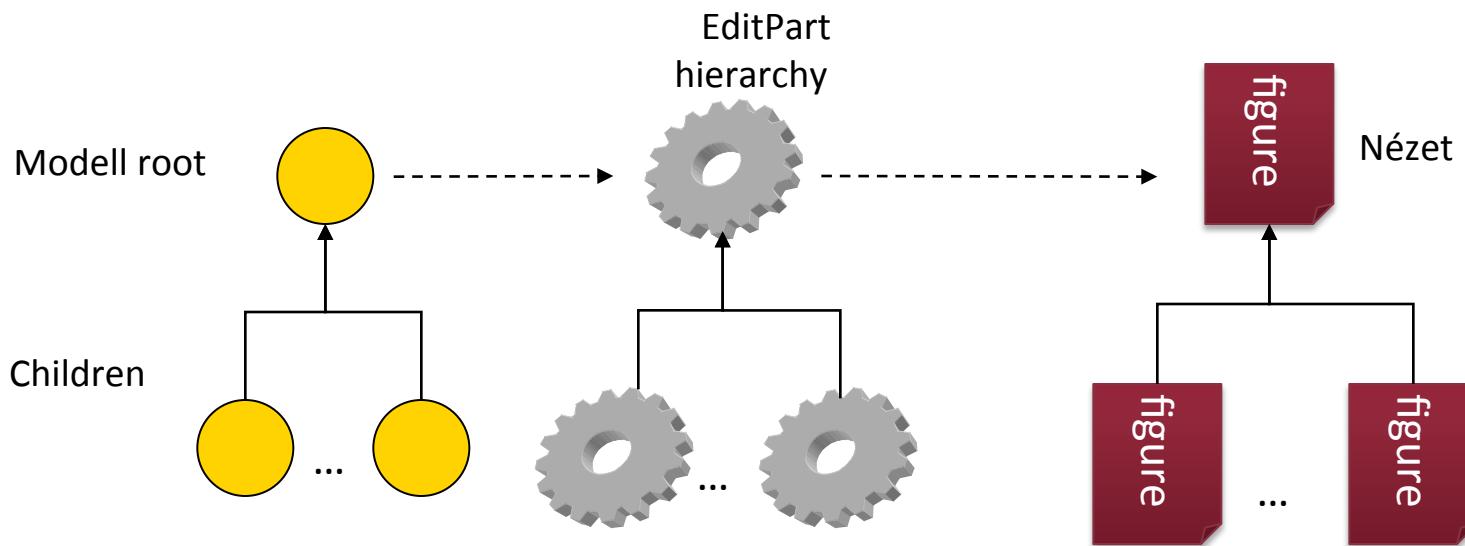

MVC in GEF: Controller

- Controller: EditPart classes
 - Connection between model and view
 - 1 Figure <-> 1 EditPart
 - 1 model element-> multiple EditPart
 - Thus multiple Figures
 - Updating Figures on changes
 - Handling user actions
 - Executes model manipulation

View initialization

- EditPartFactory
 - Creates EditPart instances for selected model element
- Figure instantiation
 - GraphicalEditPart.createFigure()

EditPartFactory

```
public class TestGEFEditPartFactory
    implements EditPartFactory {
    public EditPart createEditPart(EditPart
context, Object model) {
        EditPart ep = null;
        if (model instanceof ElementModel)
            ep = new ElementEditPart();
        else if (model instanceof ParentModel)
            ep = new ParentEditPart();
        if (ep != null)
            ep.setModel(model);
        return ep;
    }
}
```

EditPartFactory

```
public class TestGEFEditPartFactory  
    implements EditPartFactory {  
    public EditPart createEditPart(EditPart  
        context, Object model) {  
        EditPart ep = null;  
  
        if (model instanceof Element) Parent EditPart  
            ep = new ElementEditPart()  
        else if (model instanceof ParentModel)  
            ep = new ParentEditPart();  
  
        if (ep != null)  
            ep.setModel(model);  
        return ep;  
    }  
}
```

EditPartFactory

```
public class TestGEFEditPartFactory
    implements EditPartFactory {
    public EditPart createEditPart(EditPart
context, Object model) {
        EditPart ep = null;
        if (model instanceof ElementModel)
            ep = new ElementEditPart();
        else if (model instanceof ParentModel)
            ep = new ParentEditPart();
        if (ep != null)
            ep.setModel(model);
        return ep;
    }
}
```

EditPartFactory

```
public class TestGEFEditPartFactory  
    implements EditPartFactory {  
    public EditPart createEditPart(EditPart  
        context, Object model) {  
        EditPart ep = null;  
  
        if (model instanceof ElementModel)  
            ep = new ElementEditPart();  
        else if (model instanceof ParentModel)  
            ep = new ParentEditPart();  
  
        if (ep != null)  
            ep.setModel(model);  
        return ep;  
    }  
}
```

EditPart stores a
model reference

View generation

- In EditPart class

```
public class ElementEditPart extends  
AbstractGraphicalEditPart {  
    ...  
    @Override  
    protected IFigure createFigure() {  
        // Create custom figure  
        ElementFigure fig = new  
        ElementFigure();  
        return fig;  
    }  
    ...  
}
```

Model traversal

- Initial GEF model
 - EditPartFactory
 - Model root
- How to traverse to other elements?
 - EditPart instances know their children
 - Recursive traversal
 - Containment circle is a bad idea ☺
 - Containment hierarchy should be connected
 - EMF containment hierarchy **may** be the same

Model traversal

- `EditPart.getModelChildren()`
 - Returns the children of the connected model element
 - Ordering important -> determines covering

```
public class TestParentEditPart extends  
AbstractGraphicalEditPart {  
    ...  
    @Override  
    protected List getModelChildren() {  
        // Query own model  
        ParentModel pm = ((ParentModel)  
getModel());  
        return pm.getChildren();  
    }  
    ...  
}
```

Model dependent,
not GEF specific

Model traversal

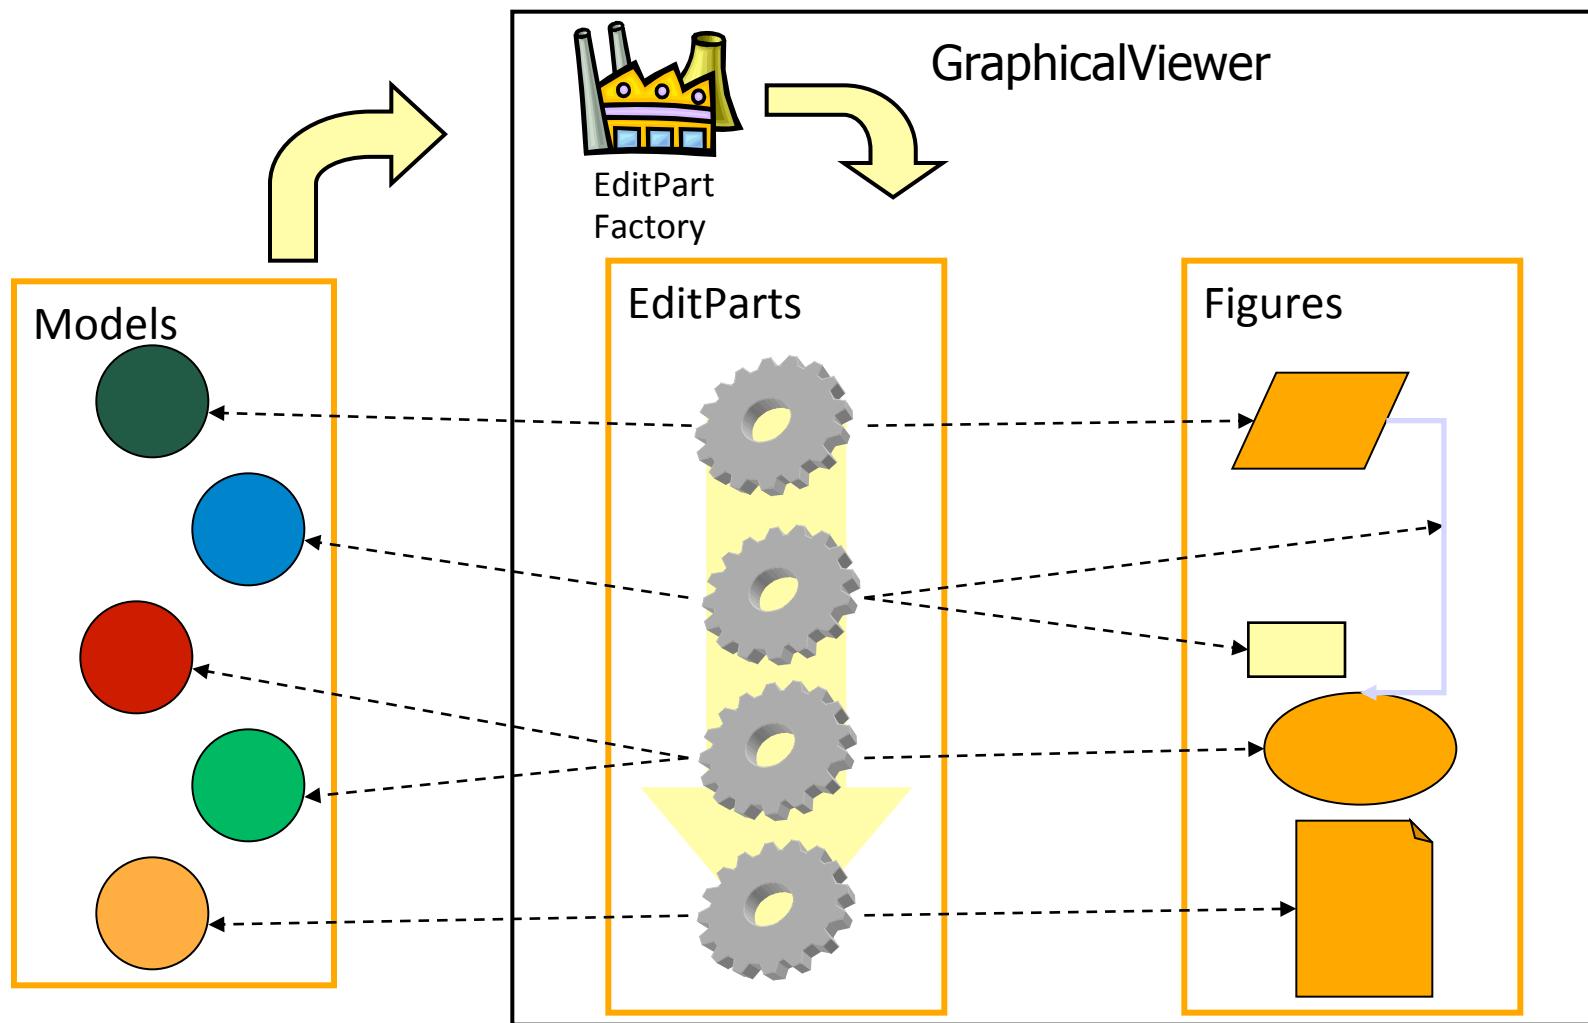

- `EditPart.getModelChildren()`
 - Returns the children of the connected model element
 - Ordering important -> determines covering

```
public class TestParentEditPart extends  
AbstractGraphicalEditPart {  
    ...  
    @Override  
    protected List getModelChildren() {  
        // Query own model  
        ParentModel pm = ((ParentModel)  
getModel());  
        return pm.getChildren();  
    }  
    ...  
}
```

Model query

Model dependent,
not GEF specific

Building view - Summary

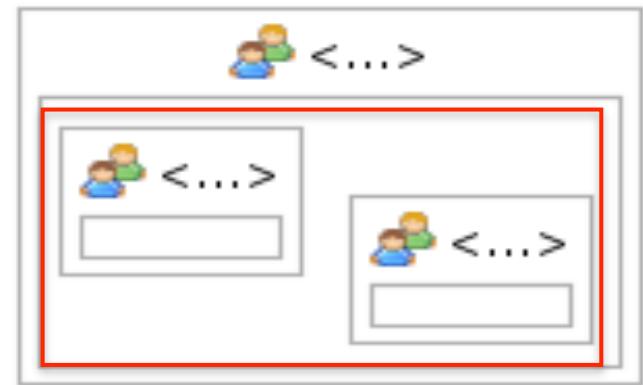

ContentPane

- ContentPane: place of Figure to present children
- By default: entire Figure
- EditPart overrides
 - If only a child of Figure needed

...

```
@Override  
public IFigure getContentPane() {  
    return ((MyFigure)  
getFigure()).getPlaceOfChildren();  
}
```

...

View update on changes

- EditPart listens to model changes
 - activate(), deactivate()
- Calls refresh methods
 - refreshVisuals(): non-structural change
 - refreshChildren(): child list changed

EditPart example

```
public class ParentEditPart extends AbstractGraphicalEditPart
    implements MyModelListener {
protected void refreshVisuals() {
    ((ParentView) getFigure()).setLabel(
        ((ParentModel) getModel()).getName());
}
public void activate() {
    super.activate();
    ((ParentModel) getModel()).addListener(this);
}
public void deactivate() {
    ((ParentModel) getModel()).removeListener(this);
    super.deactivate();
}
public void modelChanged() {
    refreshVisuals();
    refreshChildren();
}
}
```

EditPart example

```
public class ParentEditPart extends AbstractGraphicalEditPart
    implements MyModelListener {

protected void refreshVisuals() {
    ((ParentView) getFigure()).setLabel(
        ((ParentModel) getModel()).getName());
}

public void activate() {
    super.activate();
    ((ParentModel) getModel()).addListener(this);
}

public void deactivate() {
    ((ParentModel) getModel()).removeListener(this);
    super.deactivate();
}

public void modelChanged() {
    refreshVisuals();
    refreshChildren();
}
}
```

View refresh

EditPart example

```
public class ParentEditPart extends AbstractGraphicalEditPart
    implements MyModelListener {

protected void refreshVisuals() {
    ((ParentView) getFigure()).setLabel(
        ((ParentModel) getModel()).getName());
}

public void activate() {
    super.activate();
    ((ParentModel) getModel()).addListener(this);
}

public void deactivate() {
    ((ParentModel) getModel()).removeListener(this);
    super.deactivate();
}

public void modelChanged() {
    refreshVisuals();
    refreshChildren();
}
}
```

Register
change listener

EditPart example

```
public class ParentEditPart extends AbstractGraphicalEditPart
    implements MyModelListener {

protected void refreshVisuals() {
    ((ParentView) getFigure()).setLabel(
        ((ParentModel) getModel()).getName());
}

public void activate() {
    super.activate();
    ((ParentModel) getModel()).addListener(this);
}

public void deactivate() {
    ((ParentModel) getModel()).removeListener(this);
    super.deactivate();
}

public void modelChanged() {
    refreshVisuals();
    refreshChildren();
}

}
```

Remove
change listener

EditPart example

```
public class ParentEditPart extends AbstractGraphicalEditPart
    implements MyModelListener {
protected void refreshVisuals() {
    ((ParentView) getFigure()).setLabel(
        ((ParentModel) getModel()).getName());
}
public void activate() {
    super.activate();
    ((ParentModel) getModel()).addListener(this);
}
public void deactivate() {
    ((ParentModel) getModel()).removeListener(this);
    super.deactivate();
}
public void modelChanged() {
    refreshVisuals();
    refreshChildren();
}
}
```

This is called
by model

EditPart example

```
public class ParentEditPart extends AbstractGraphicalEditPart
    implements MyModelListener {

protected void refreshVisuals() {
    ((ParentView) getFigure()).setLabel(
        ((ParentModel) getModel()).getName());
}

public void activate() {
    super.activate();
    ((ParentModel) getModel()).addListener(this);
}

public void deactivate() {
    ((ParentModel) getModel()).removeListener(this);
    super.deactivate();
}

public void modelChanged() {
    refreshVisuals();
    refreshChildren();
}
}
```

Refreshing
children

Editing Workflow

Editing Workflow

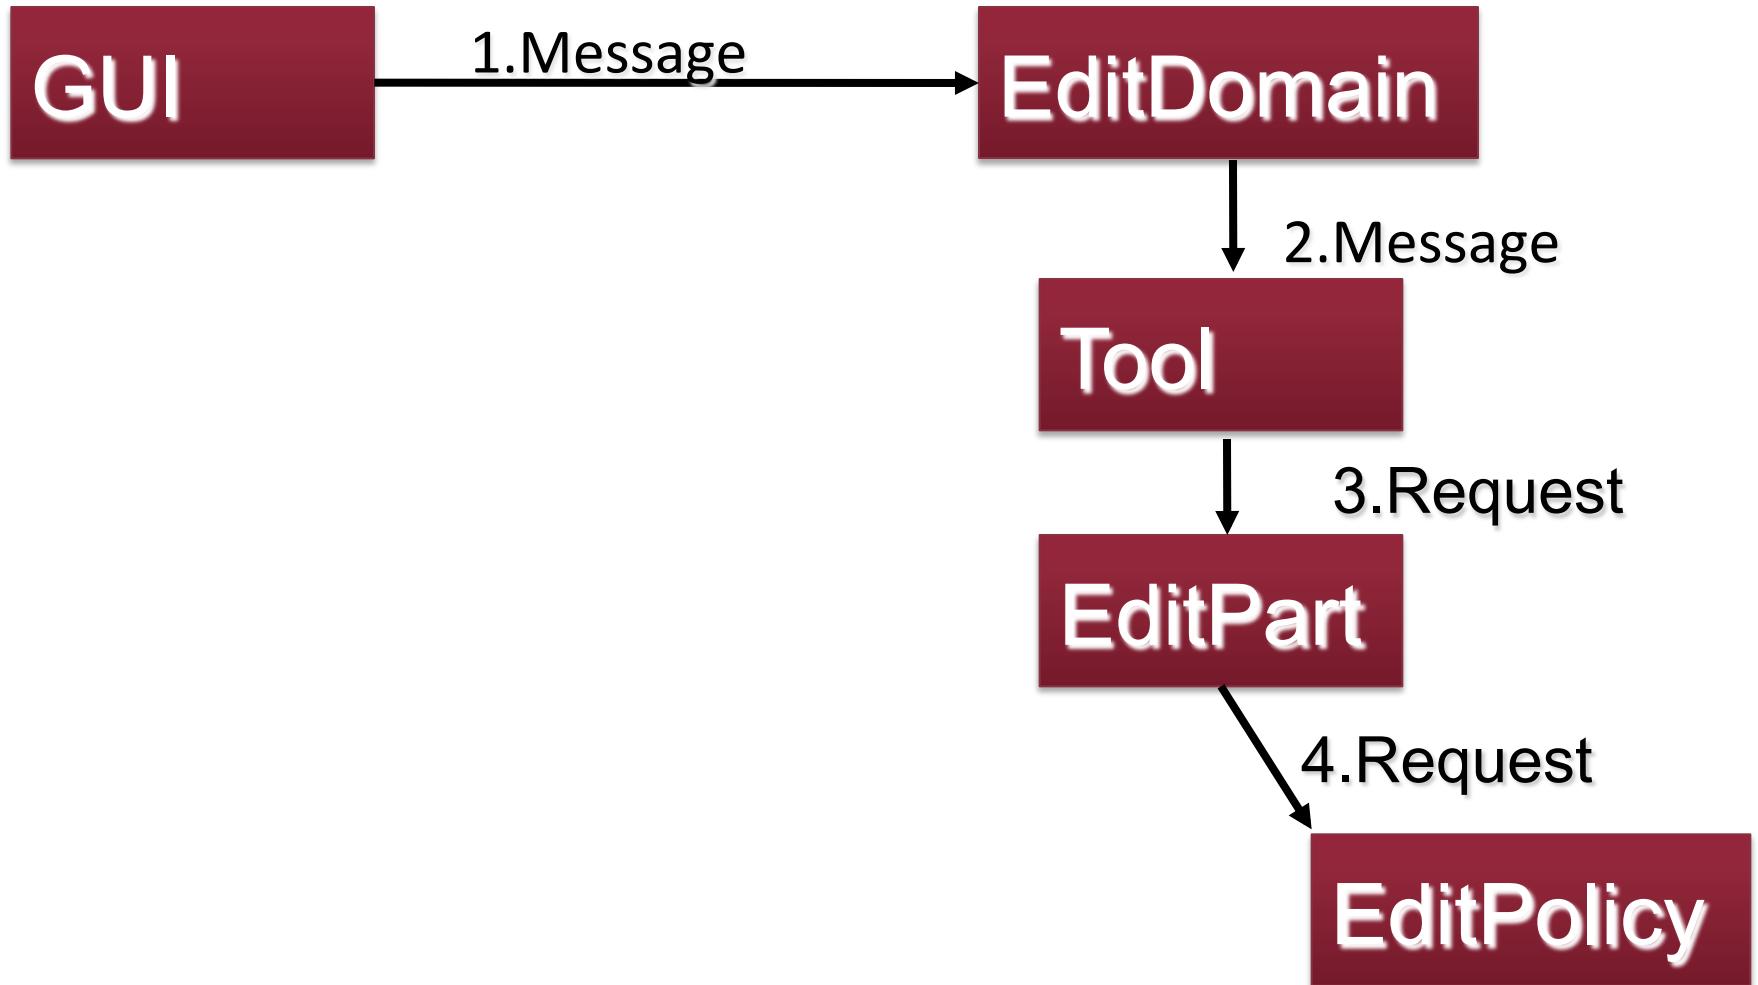

Editing Workflow

Actors of editing I.

- EditDomain
 - Dispatches GUI events to selected tool
 - Does not process
- Tool:
 - Represents an editing function
 - Processes GUI messages
 - Creates (one or more) Requests
 - E.g., SelectionTool, CreationTool, MarqueeTool
 - Custom tools can be used

Actors of Editing II.

- Request
 - GEF-level event
 - Pl. CreateRequest, DeleteRequest,
ChangeBoundsRequest
 - Forwarded to target EditPart
- EditPolicy
 - „Editing rule” of EditPart
 - Request -> Command mapping
 - 1 EditPart -> multiple EditPolicies (often)

Actors of Editing III.

■ EditPart

- Based on EditPolicies creates Commands
- Receives model change notification
- Refreshes structure (and may create child EditPart)

Actors of Editing IV.

■ Command

- Executes model manipulation
- Undoable (if implemented ☺)
- *See EMF.Edit commands (same idea, different impl.)*

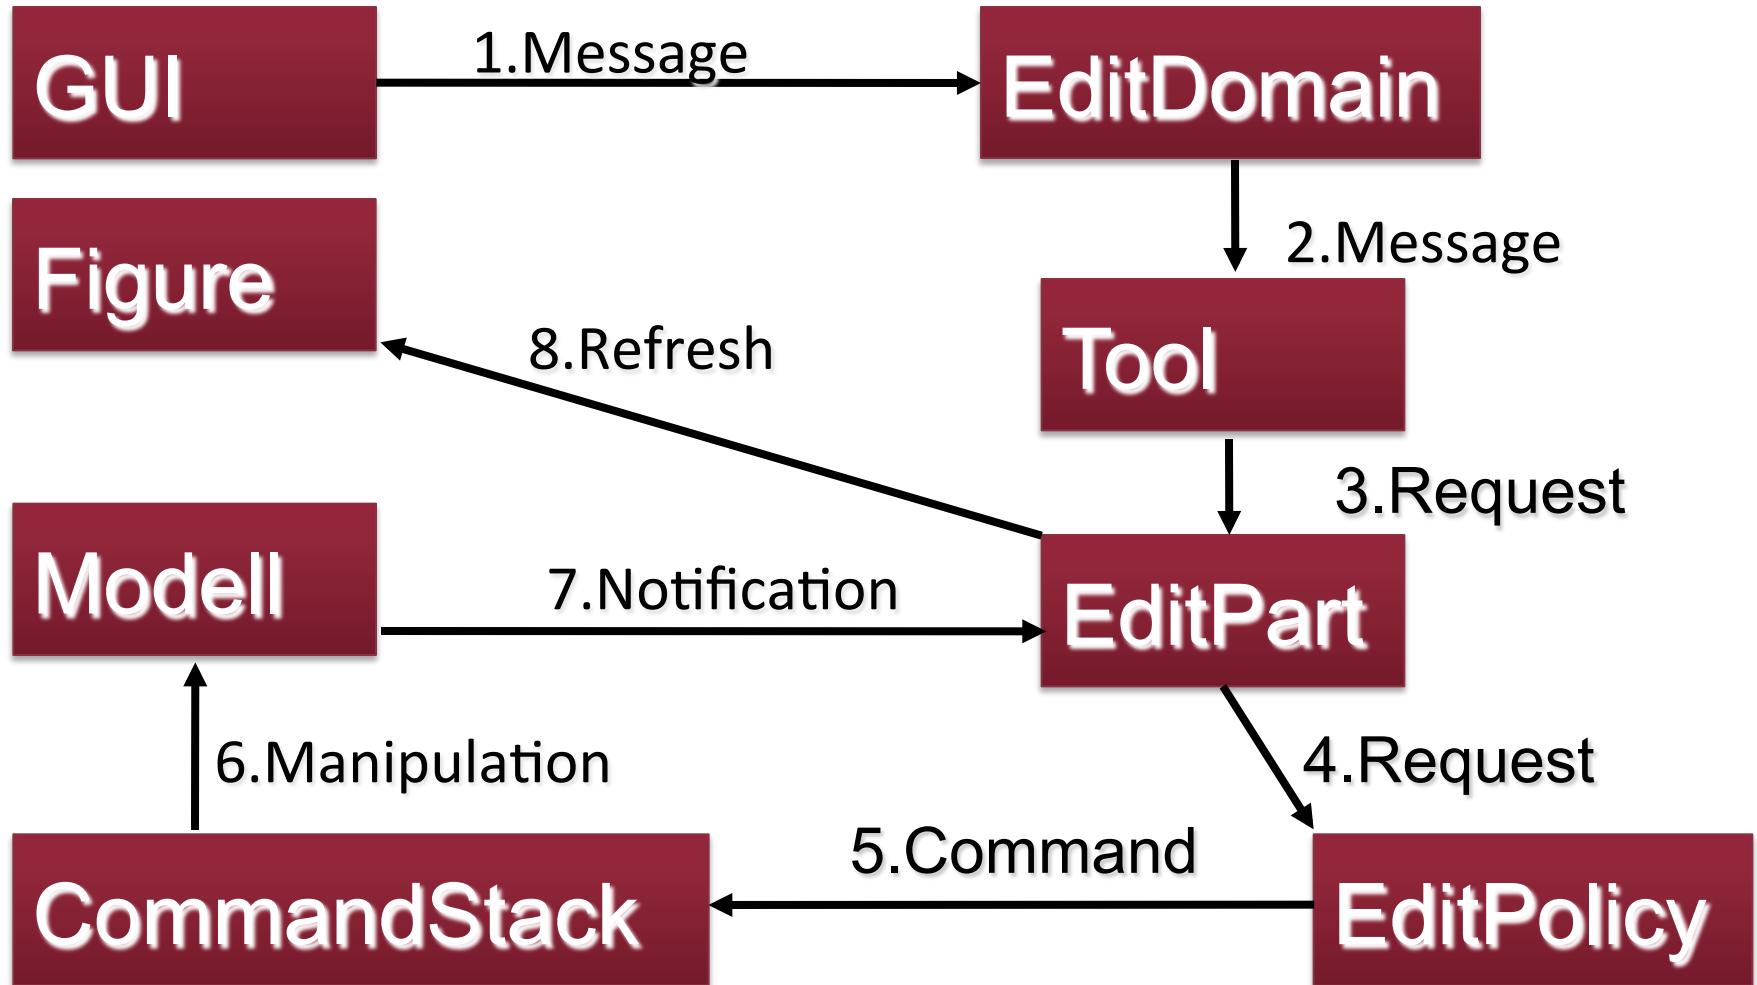

■ CommandStack

- A stack of executed commands
- Undo/redo executed over this
- One for each EditDomainen
- Always execute commands through stack
- *See EMF.Edit EditingDomain*

Actors of Editing V.

- Action
 - Not GEF-specific (JFace)
 - Custom commands
 - Menu items
 - GEF provides wrappers to connect to CommandStack
 - ActionRegistry: list of actions

Editing workflow

What to implement? - 1.

- Model code with notification support
 - Generatable with EMF
- View classes
- EditPart classes 1.
 - Model display
 - `createFigure()`, `refreshVisuals()`
 - Model change listening
 - `activate()`, `deactivate()`
- EditPartFactory (model -> EditPart)

What to implement? – 2.

- Model modification Commands
- Custom EditPolicies
 - Defines available operations
- EditPart classes 2.
 - EditPolicy assignment
- Editor and related parts
 - EditPartViewer, Palette

Arrows (connectors)

- Similar to object
 - With important distinctions
- Display in higher layer
- Connector Edit Parts
 - AbstractConnectionEditPart descendants
 - EditPolicy, Request, etc.
- Directed connection (on model level)
- *Not detailed here*

Further Capabilities

- Eclipse Properties view support
- Direct editing of labels
- Zoom support
- Arrangement
- Separate tree and graphical outline
- *Not detailed here*

GEF – Further materials

- Create an Eclipse-based application using the Graphical Editing Framework
 - IBM Developerworks:

- Vainolo tutorials:
 - <http://www.vainolo.com/tutorials/>
- GEF wiki:
 - http://wiki.eclipse.org/GEF/Articles%2C_Tutorials%2C_Slides

Graphiti, GMF

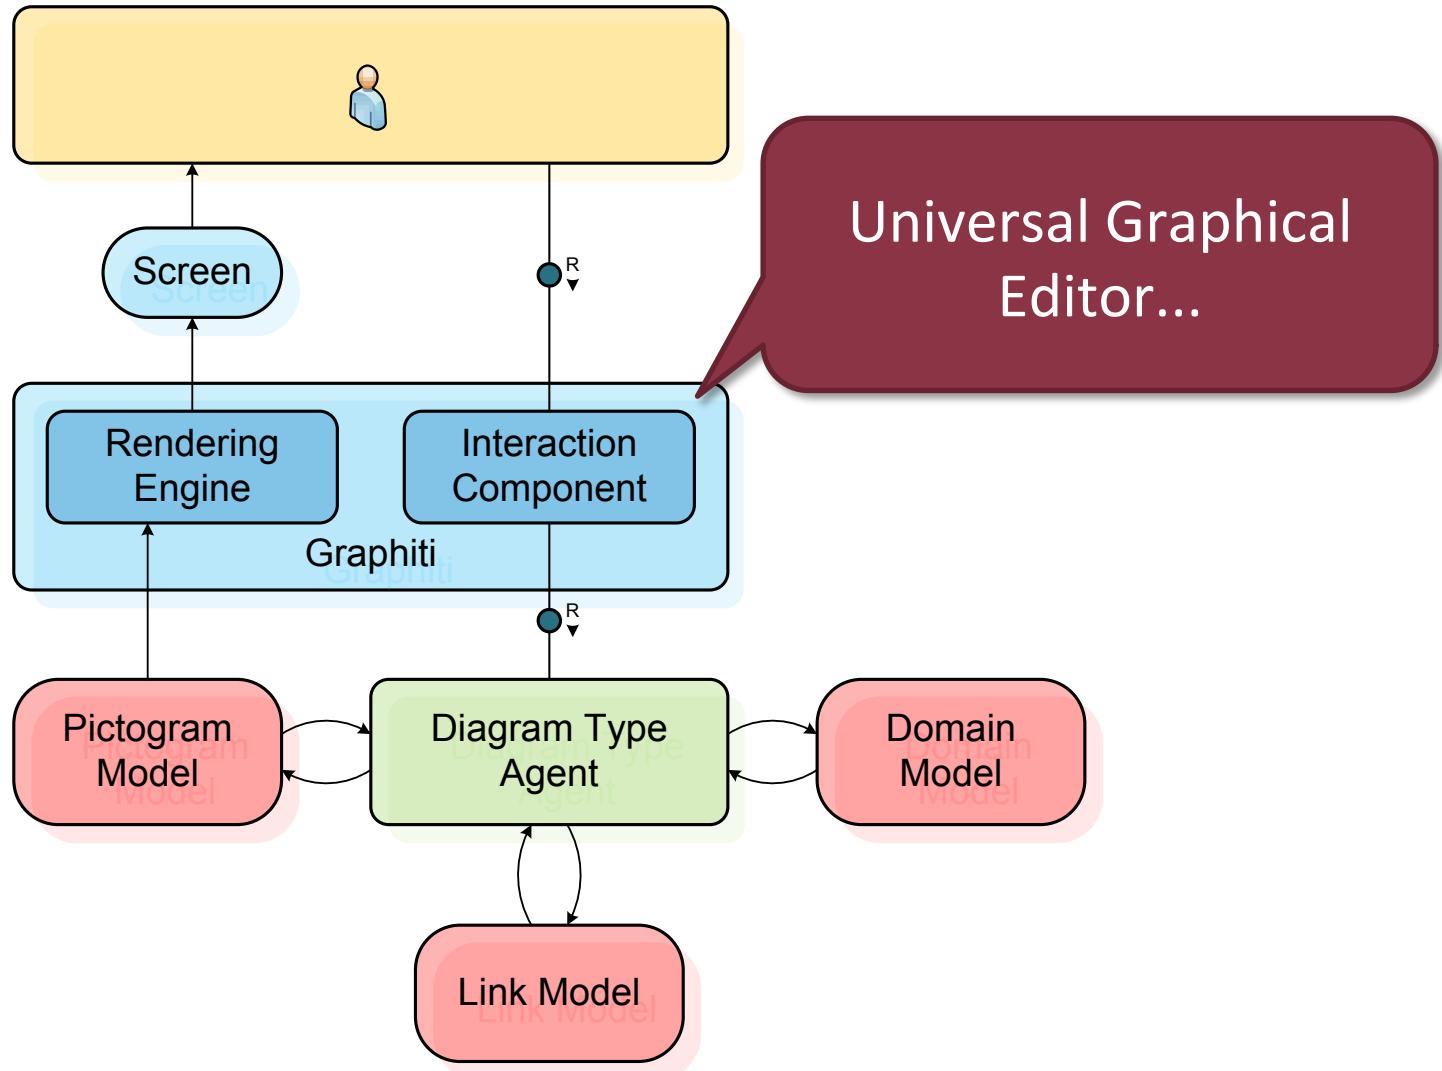

Problems using GEF

- Very complex
- Lot of redundant, hand-written code
- Example: simple GEF editor
 - Two node types with edges between them
 - 3400 lines of code (w/o model)
 - 16 classes, 150 methods...
- Something more simple is needed

Simplification

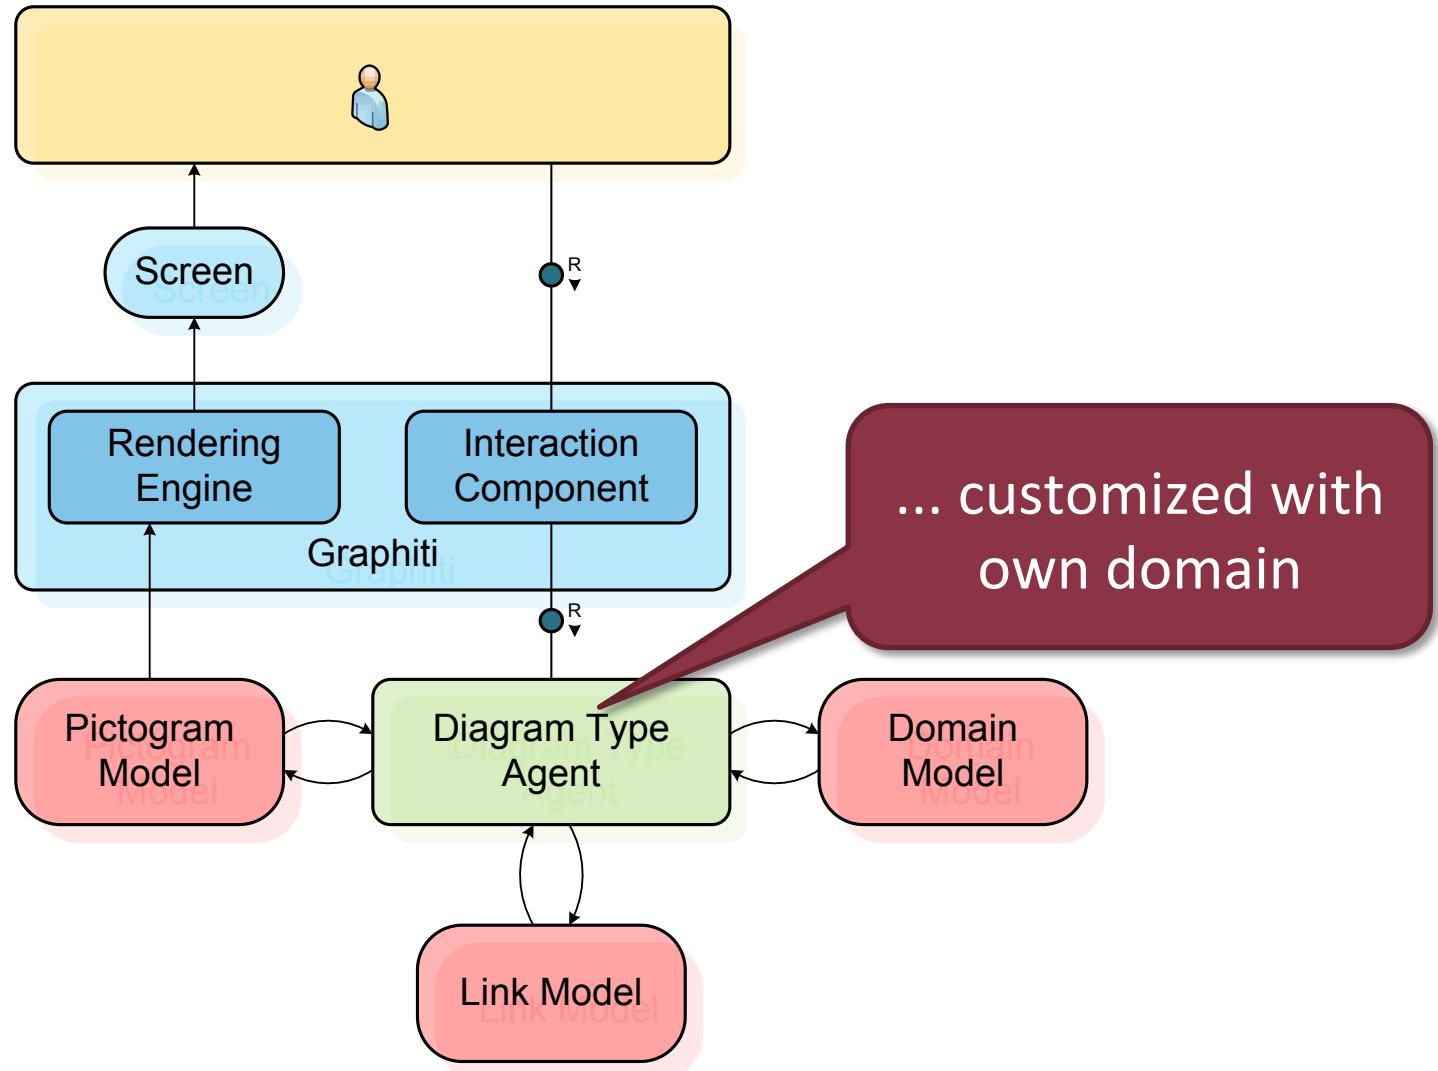

- EMF models
 - Uniform handling
 - Load/save simple
 - Interfile dependencies manageable
- Simpler interaction
 - Only high-level functions directly supported

Architecture of Graphiti

Result

Source: <http://www.slideshare.net/michaelwenz/short-talk-on-graphiti-at-eclipsecon-2010>

Basic terms

Pictogram and link model

- Pictogram metamodel
 - Displayable object
 - EMF model
 - Metamodel available: <http://eclipse.org/graphiti/images/pictograms.pdf>
- Link
 - Traceability connections between pictogram and business model elements
 - Generic (not business model specific)

Tool building steps

1. Diagram Type Provider implementation
2. Diagram Type Provider registration
 - Extension point
3. Feature Provider implementation
4. Feature implementation

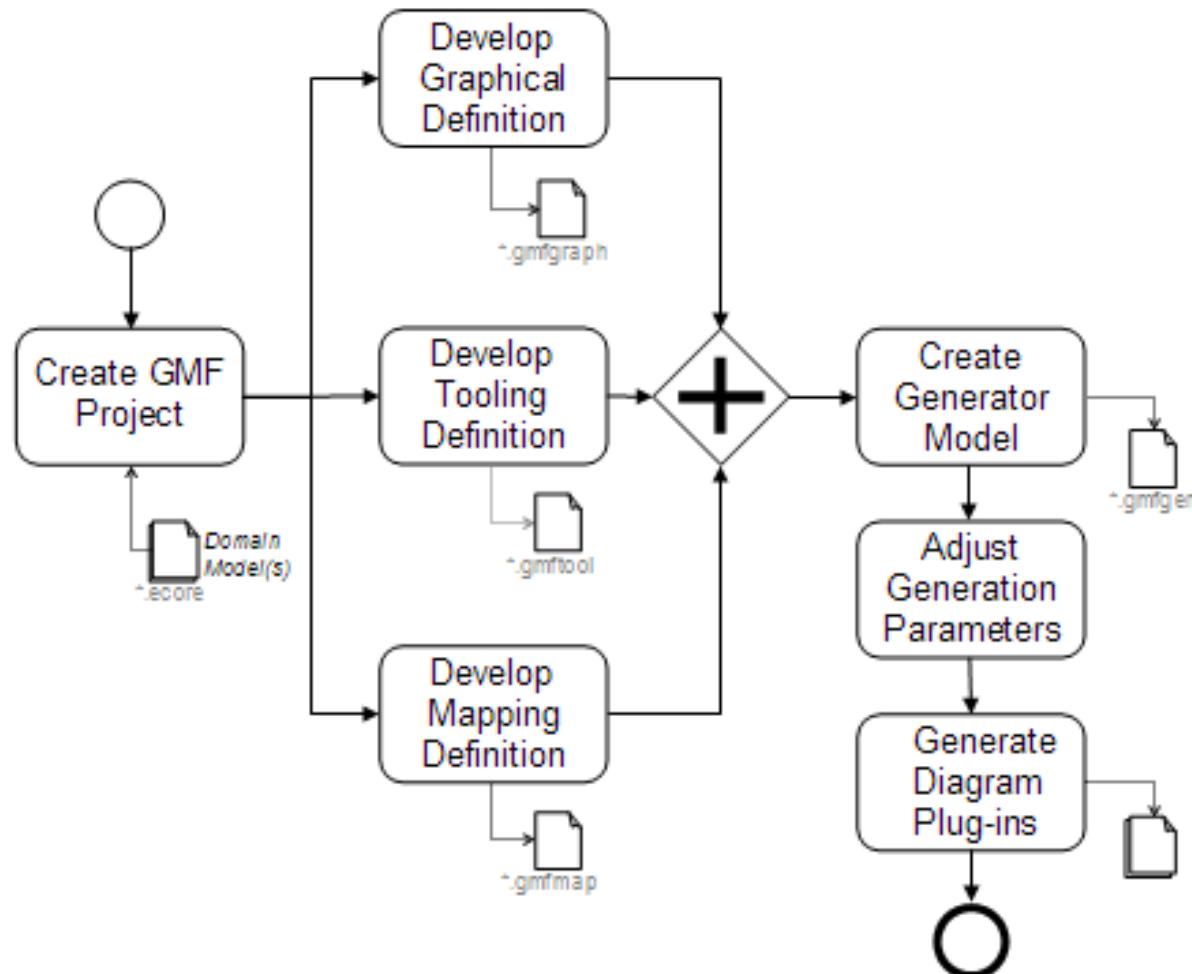

Graphiti - Summary

- Higher level library over GEF
 - Uses EMF models
 - Universal editor
- Less coding
- Uniform presentation
- But missing functions

Graphical Modeling Framework

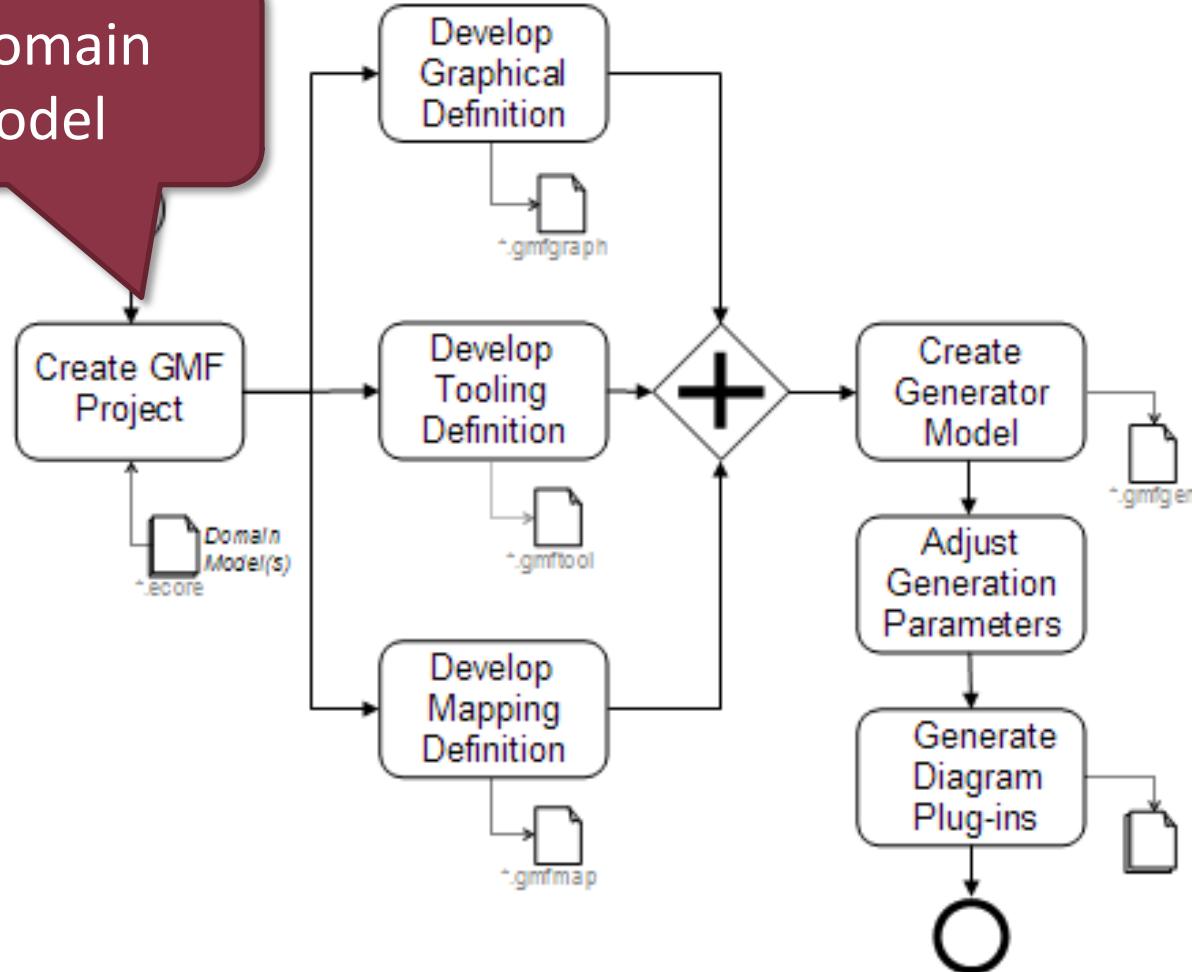

- Graphical Editors
 - Over GEF and EMF
 - Similar logic to GEF
- Code generation based tooling

Sirius

Sirius

- New modeling project
 - Since 2013 on eclipse.org
 - Previously Obeo Designer – commercial tool
- How stable is it?
 - Old projects are to be migrated
 - Version history
 - 0.9: 2013-12-10
 - 1.0: 2014-06-25 (Kepler release train)
 - 2.0: 2014-10-24, planned
 - 3.0: 2015-06-25, planned (Mars release train)

Sirius in Action – Ecore Tools 2.0

Sirius Viewpoints

- Base concept:
 - Every diagram is a view of the model
 - With a defined syntax
 - Graphical
 - Table/Tree syntax
 - Xtext-based textual syntax
- Viewpoint definition
 - Viewpoint specification model

Viewpoint Specification Model

Screenshot of the Sirius Specification Editor showing the PetriNet.odesign viewpoint specification.

The left pane displays the project structure:

- PetriNet.odesign
- Sirius Specification Editor
- platform:/resource/hu.bme.mit.viatra.petrinet.design/description/PetriNet.odesign
 - PetriNet
 - Petri Nets
 - Petri Net Diagram

Node Mapping

Screenshot of a software interface showing the properties of a node named "PetrinetTransition".

The top bar includes tabs for Properties, Model requests interpreter, and Problems.

The main area shows the following details:

- General** tab selected.
- ID:** PetrinetTransition
- Label:** PetrinetTransition
- Domain Class:** petrinet.Transition
- Semantic Candidates Expression:** feature:transitions

Node Mapping

Domain class

The screenshot shows the Eclipse Modeling Framework (EMF) Properties view for a selected element named "PetrinetTransition". The view has tabs for General, Import, Documentation, Behavior, and Advanced. The General tab is selected. The properties listed are:

- ID:** `PetrinetTransition` (highlighted with a red arrow)
- Label:** `PetrinetTransition`
- Domain Class:** `petrinet.Transition` (highlighted with a green arrow)
- Semantic Candidates Expression:** `feature:transitions`

Node Mapping

The screenshot shows a software interface with a toolbar at the top containing 'Properties', 'Model requests interpreter', and 'Problems' tabs. Below the toolbar, a navigation bar indicates the current node is 'PetrinetTransition'. On the left, a vertical sidebar lists tabs: General (selected), Import, Documentation, Behavior, and Advanced. The main panel displays node mapping settings for 'PetrinetTransition'. The 'Id' field contains 'PetrinetTransition'. The 'Label' field also contains 'PetrinetTransition'. The 'Domain Class' dropdown is set to 'petrinet.Transition', which is highlighted with a green background. Below it, the 'Semantic Candidates Expression' dropdown contains 'feature:transitions'. A large red arrow points from the text 'Domain class' to the 'Label' field. Another large red arrow points from the text 'Filter settings' to the 'Domain Class' dropdown.

TPArc

General ID: TPArc Label: TPArc

Path Domain Class: petrinet.TPArc

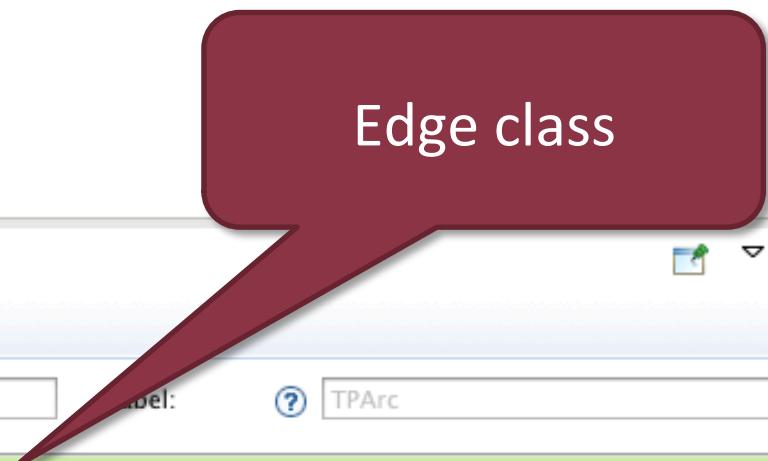

Documentation Source Mapping: PetrinetTransition

Behavior Source Finder Expression: feature:source

Advanced Target Mapping: PetriNetPlace

Target Finder Expression: feature:target

Semantic Candidates Expression:

The screenshot shows the Eclipse IDE interface with the 'Properties' view open for an 'TPArc' object. The 'Path' tab is selected. The 'Domain Class' field contains the value 'petrinet.TPArc', which is highlighted with a green background. A red speech bubble originates from the word 'Edge class' in the title and points directly at this green-highlighted field. Other fields visible include 'Label' (TPArc), 'Source Mapping' (PetrinetTransition), 'Source Finder Expression' (feature:source), 'Target Mapping' (PetriNetPlace), 'Target Finder Expression' (feature:target), and 'Semantic Candidates Expression'.

Edge Mapping

The screenshot shows a software interface for managing edge mappings. On the left, there's a sidebar with tabs: General (selected), Path, Documentation, Behavior, and Advanced. The main area displays properties for an object named 'TPArc'. The properties listed are:

- ID: TPArc
- Label: TPArc
- Domain Class: petrinet.TPArc
- Source Mapping: PetrinetTransition
- Source Finder Expression: feature:source
- Target Mapping: PetriNetPlace
- Target Finder Expression: feature:target
- Semantic Candidates Expression: (empty)

Two large, semi-transparent callout boxes are overlaid on the interface:

- A dark red box labeled "Edge class" points to the "Label" field.
- A dark green box labeled "Source features" points to the "Source Mapping" field.

Edge Mapping

The screenshot shows a software interface for managing edge mappings. On the left, there's a sidebar with tabs: General (selected), Path, Documentation, Behavior, and Advanced. The main area displays properties for an object named 'TPArc'. The properties are:

- ID:** TPArc
- Label:** TPArc
- Domain Class:** petrinet.TPArc
- Source Mapping:** PetrinetTransition
- Source Finder Expression:** feature:source
- Target Mapping:** PetriNetPlace
- Target Finder Expression:** feature:target
- Semantic Candidates Expression:** (empty)

Three large, semi-transparent callout bubbles point to specific fields:

- A red callout bubble points to the 'Domain Class' field, labeled "Edge class".
- A green callout bubble points to the 'Source Mapping' field, labeled "Source features".
- A blue callout bubble points to the 'Target Mapping' field, labeled "Target features".

Sirius Editors

- Very opinionated
 - Custom project nature (Modeling project)
 - Custom perspective + Model Browser
 - Results in unusual workflows
 - E.g. how to open a diagram from the Java perspective?

Summary

Summary – Graphical Editors

	GEF	Graphiti	GMF	Sirius
Model	Any	EMF	EMF	EMF
Non-graph display	Possible	Not	Many, complex coding needed	Tree, table, textual views supported
Implementation amount	Many, repetitive code	Medium amount of code	Mostly modeling, some coding	High-level modeling
Workflow	Only coding	Only coding	Multi-step	Modeling
