

Requirements analysis

- **Requirements engineering (RE)** is the process of *identifying*, *organizing*, and *documenting* the continuously changing requirements of a project
- **Requirement**: a condition or capability to which the system must conform
- An early identification of requirements is critical for the quality of the system under design

 consistent?, complete? unambiguous?
- Gathering of requirements is a very complex engineering task
 - "Requirements do not come from the air"
 - an iterative refinement process with regular control

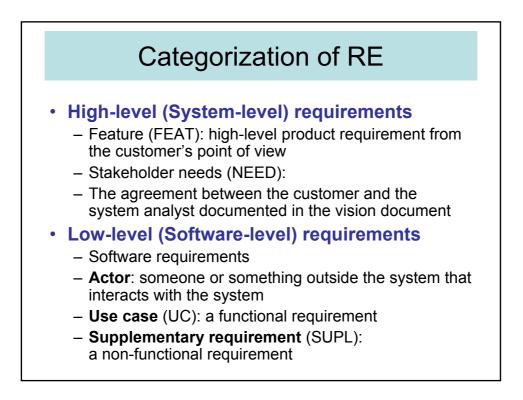

Problems of Requirements Analysis (Surveys)

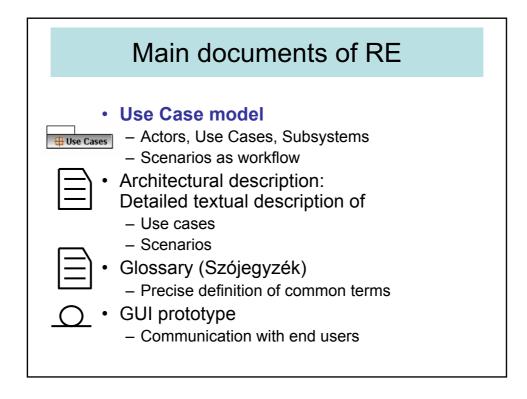

- Failure of SW projects:
 - 1/3 never completed
 - an additional 1/2 completed with only partial success
- · Causes of failure:
 - Problems with requirements specification >50%
 - 13%: lack of interaction with users
 - 12%: incomplete requirements
 - 11%: changing requirements
 - 11%: irreal or unclear requirements

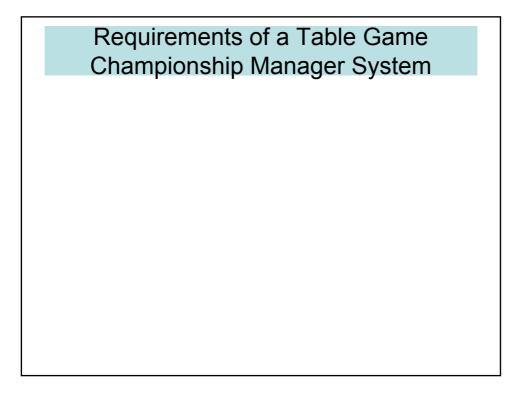

Definition of requirements analysis

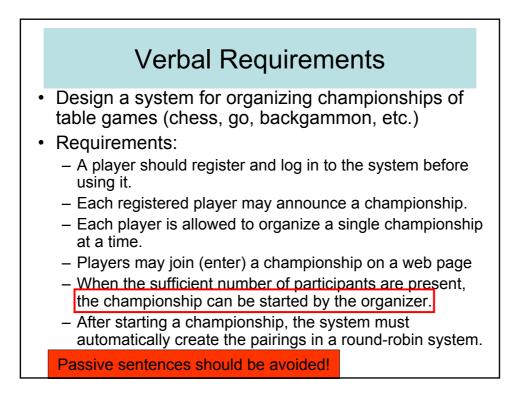

Identification of

- Goals: the objectives of the system
 Why do we need the SW?
- Services ("operationalization")
 What functionality do we need to design?
- Constraints
 - Restrictions of the design process (e.g. cost, deadlines)
- Responsibilities to each requirement (SW vs. human)

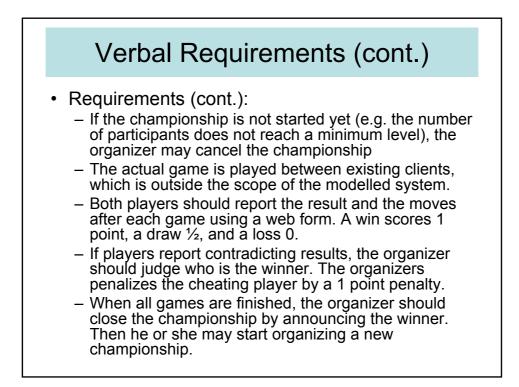

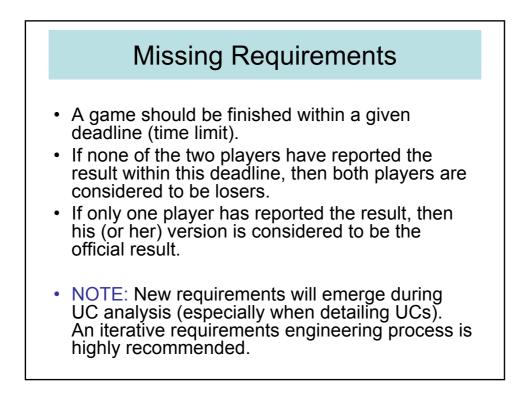

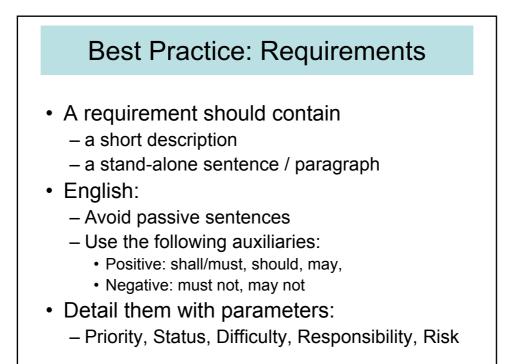

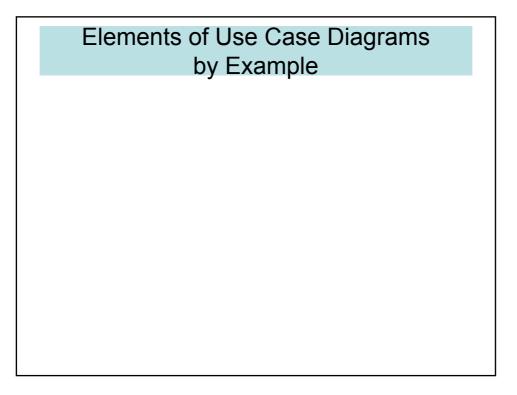

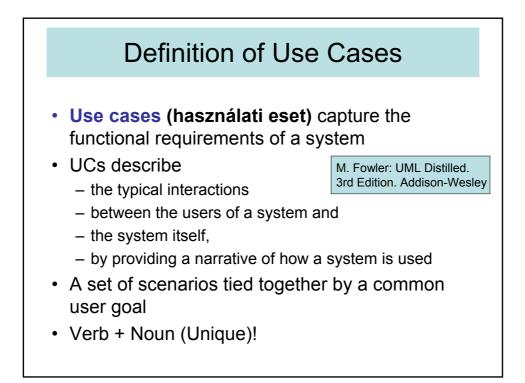

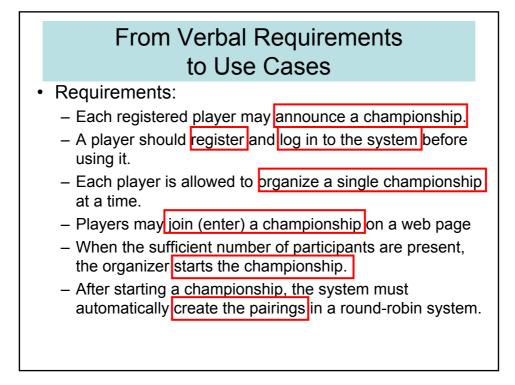

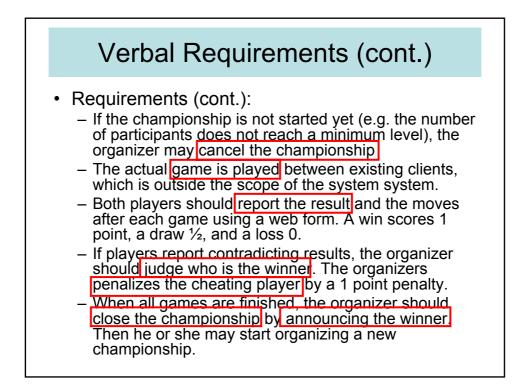

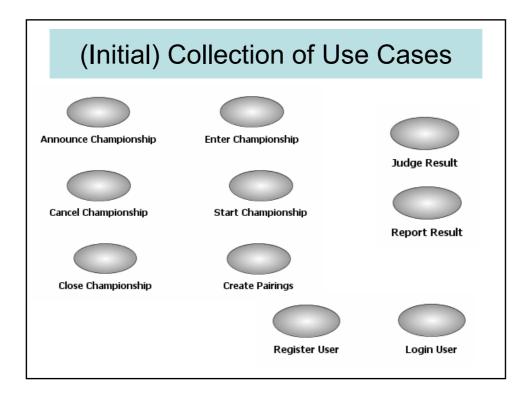

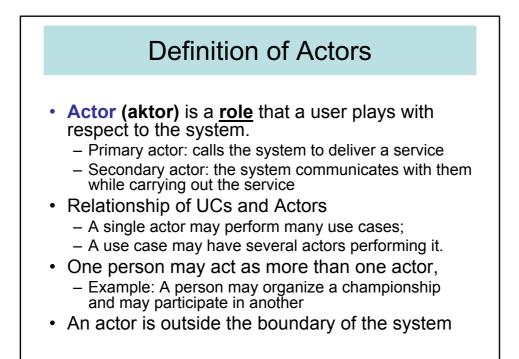

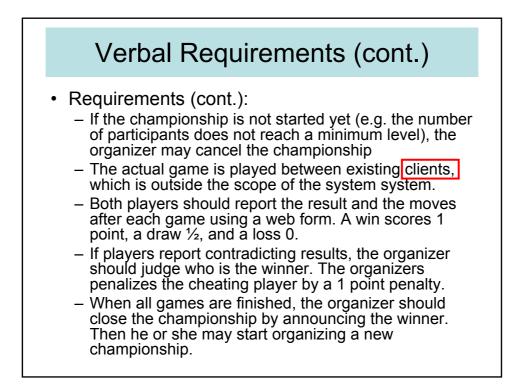

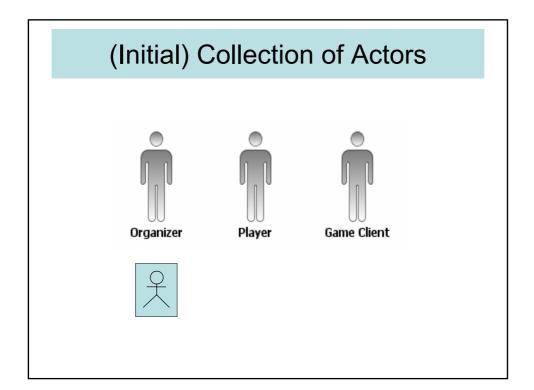

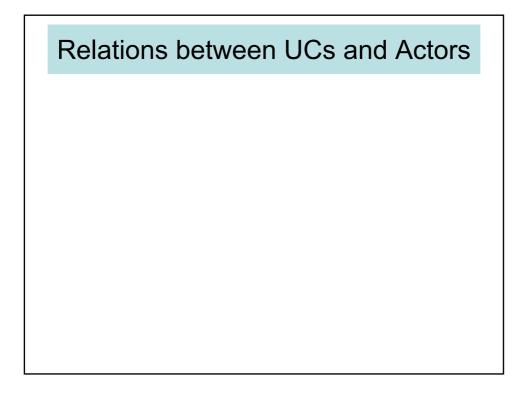

From Verbal Requirements to Use Cases

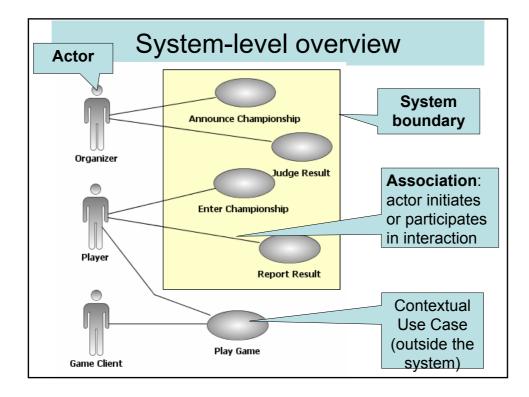

• Requirements:

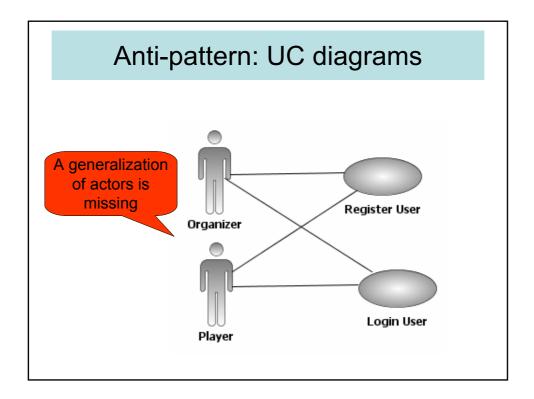

- Each registered player may announce a championship.
- A player should register and log in to the system before using it.
- Each player is allowed to organize a single championship at a time.
- Players may join (enter) a championship on a web page
- When the sufficient number of participants are present, the organizer starts the championship.
- After starting a championship, the system must automatically create the pairings in a round-robin system.

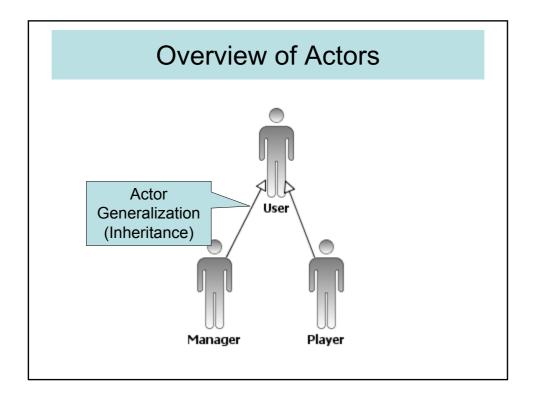

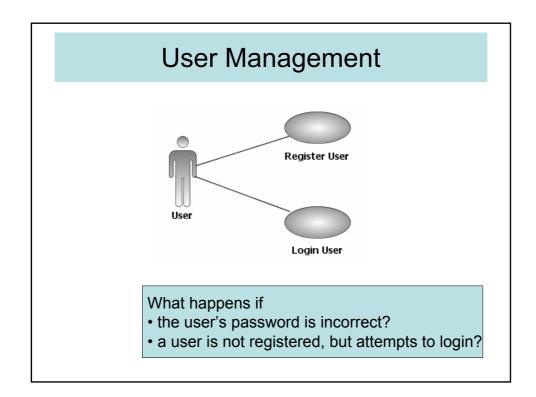

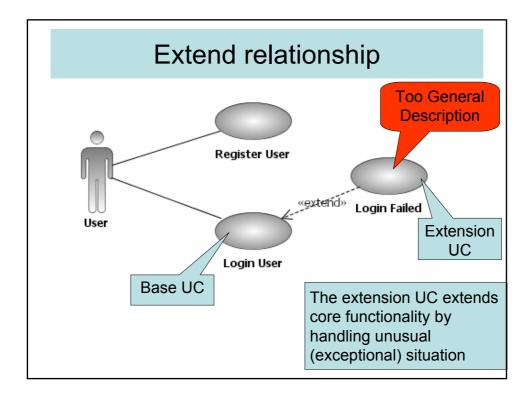

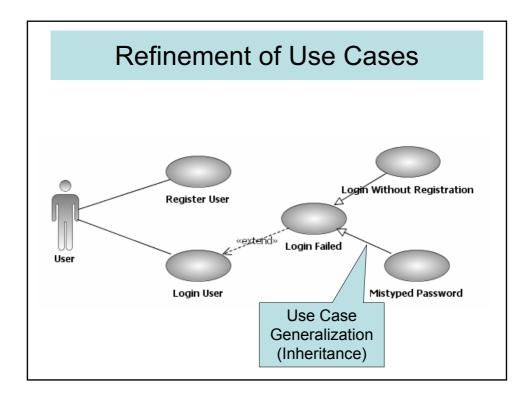

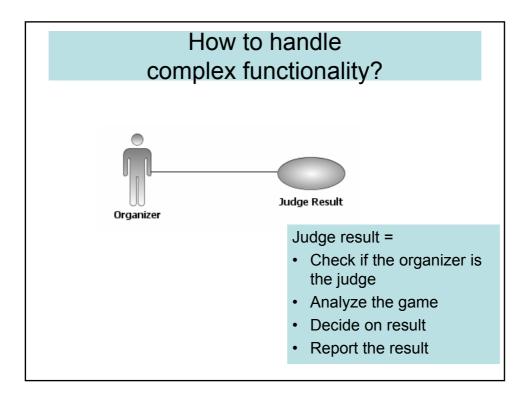

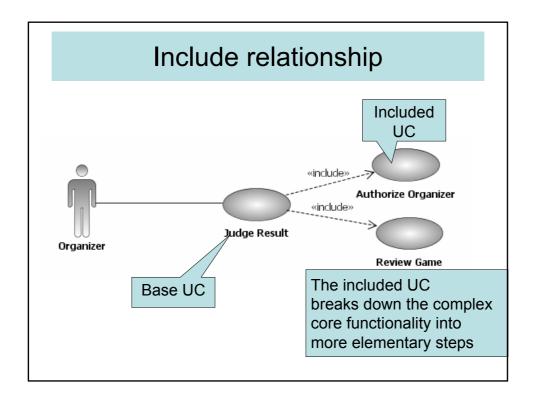

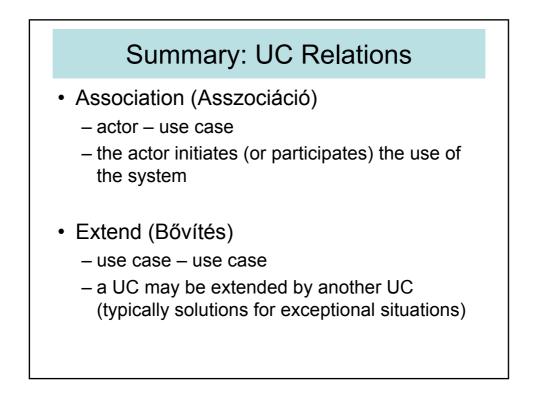

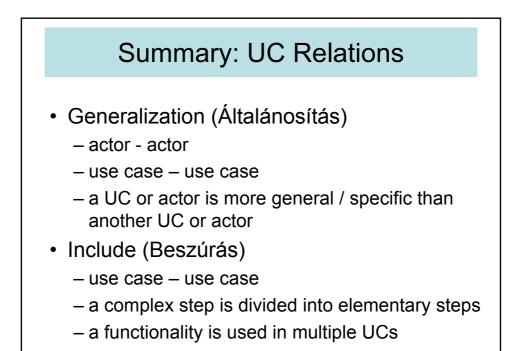

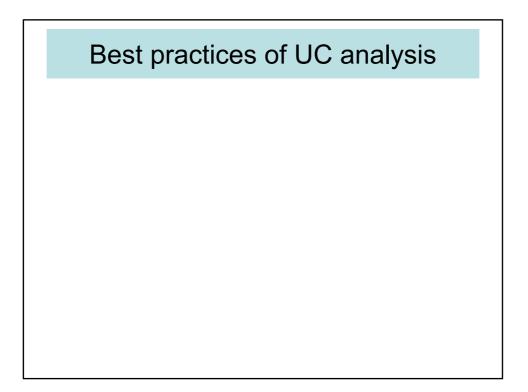

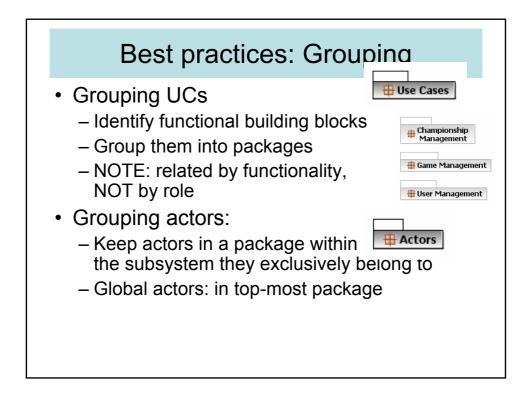

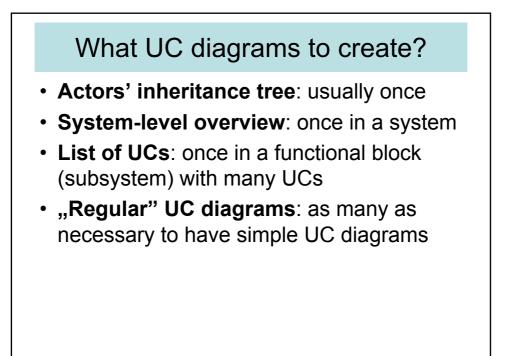

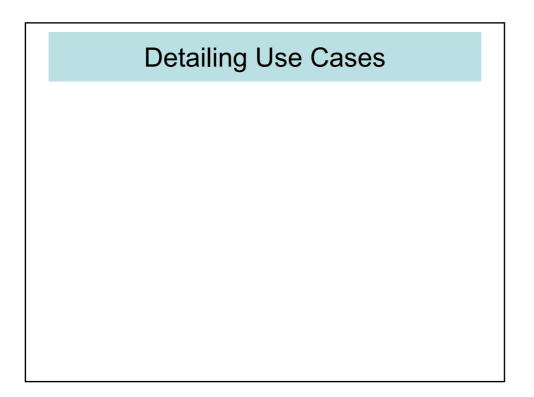

Best practices: Naming and arrange	
 Actors Name actors according to their roles avoid using job titles Divide complex roles into multiple a Start the diagram by placing the moin the top left corner Use Cases Use domain specific verbs for UCs Avoid technical descriptions – UCs are frequently for non-technica Relationships Avoid crossing or curved lines wher Use <<extend>> and <<include>> r</include></extend> Place them into the appropriate function 	ctors ost important actor Main guideline: UC diagrams should be SIMPLE Il reader In drawing relations relations "lightly"

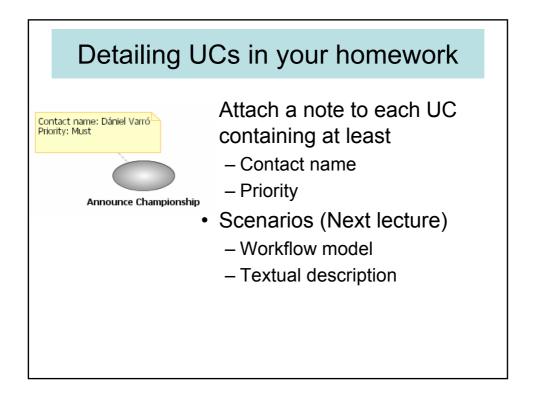

Parameters of Use Case

- Responsibility: (Contact name)
- Priority:
 Must, Should, Could
- Status:
 Proposed, Approved, Incorporated, Validated
- (Technical) Difficulty:
 - Low, Medium, High

- Risk:
 - Schedule: Low, Medium, High
 - Technology: Low, Medium, High
- Iterations:
 - Planned
 - Actual
- Stability
 - Low, Medium, High

Organization of Requirements in Rational RequisitePro

RequisitePro

- An integrated tool of IBM Rational for managing
 - High-level requirements
 - Use cases
- · Goals:
 - Facilitates communication and team work
 - Decreases project risks
- Tools:
 - Word documents
 - Requirements Database
 - Integrated into IDEs
