

# Modellalapú szoftvertervezés

Tematika, követelmények

Horváth Ákos

[ahorvath@mit.bme.hu](mailto:ahorvath@mit.bme.hu)

# A tárgyról

- Modellalapú szoftvertervezés = Model-driven Software Design (MDSD)
- Előadások
  - MDSD: Kedd 10:15-12:00, IB413
  - (SzolgInt: Hétfő 10:15-12:00, I.L.405)
- Gyakorlatok
  - Közös: Csütörtök 14:15-16:00, IB413
  - Előadások+gyakorlatok pontos beosztása a honlapon, Google Calendarban
- Honlap
  - <http://www.inf.mit.bme.hu/edu/courses/mdsd>

# A tárgy oktatói

## ■ Előadók

- Horváth Ákos
- Ráth István
- Ujhelyi Zoltán
- Polgár Balázs
- + meghívott előadók

## ■ Gyakorlatok:

- Hegedüs Ábel
- Semeráth Oszkár
- Debreceni Csaba

## ■ Szellemi atyja: Varró Dániel

# Követelmények

- **Mottó: „a gyakorlat teszi a mestert”**
  - A félév során 3 összefüggő házi feladatot kell megoldani
    - Határidőre
    - 3 fős csapatmunkában
  - Alapelv
    - modellezés + validálás + kódgenerálás
    - a megvalósítás minőségének javítása céljából
  - Kiírás: <https://www.inf.mit.bme.hu/edu/courses/mdsd/homework>  
(hamarosan)
- **Szóbeli vizsga, a házi feladatok eredménye beszámít**
  - Extra feladatok a félév során a megajánlott jegyért
- **Segédanyagok: Fóliák +**
  - Angol könyv: Model driven software engineering in practice by Brambilla, Cabot and Wimmer (fóliák is részben)

# Ütemterv

- Modellezés (7. hét: március 30.):
  - Követelmények
  - Domain modellezés (metamodellezés)
  - Állapotgépek
- Automatikus kódgenerálás (11. hét, április 27.)
  - Kódgenerálás
- Implementáció (14. hét, május 16.)
  - Modellvalidáció
  - Integrált rendszer bemutatása

# Gyakori kérdések

- Hogyan alakítsunk csapatot?
  - Rátok bízunk. Három fős csapatok legyenek.
  - A csapat nevét és a tagok névsorát feb. 13-ig küldjétek el emailben a [ahorvath@mit.bme.hu](mailto:ahorvath@mit.bme.hu) címre. (jobb lenne már ma)
- Mi lesz, ha valaki nem talál magának csapatot?
  - Majd mi találunk neki. (De csak végső esetben.)
- Mikor lesz az első gyakorlat?
  - Február 13: Bevezető, Git+Trac használata.
- Hogyan kell beadni a házi feladatot?
  - A határidő előtti nap éjfélig Git-be feltölteni,
  - A beadás külön időpontban lesz.
  - Mindhárman legyetek jelen.
  - Ügyeljetek a precíz munkanapló vezetésére! (Részletek az első gyakorlaton)

# Tanácsok

- A legfontosabb: a házi feladatot időben el kell kezdeni!
- Használjátok ki a lehetőségeket:
  - A gyakorlatokon bemutatjuk a technológiákat.
  - A demonstrátoroktól nyugodtan lehet emailben segítséget, tanácsokat kérni.
- Vegyétek komolyan a csapatmunkát!
  - Ellenőrizni fogjuk, és figyelembe vesszük a végső értékelésnél.
- Olvassátok el figyelmesen a feladatkiírásokat a honlapon!
  - A házi feladat nem pusztán szakmai kihívás,
  - projekttervezési és munkaszervezési is!
- Az előadásokra határozottan megéri bejárni.  
**A vendégelőadókéra különösen!**
- Mindig kérdezzetek bátran: [modeling@inf.mit.bme.hu](mailto:modeling@inf.mit.bme.hu)

# MDSD tematika

- Bevezető, a modellvezérelt fejlesztés alapjai
- Szoftvermodellezés
  - Követelmény analízis
  - Domain modellezés (metamodellezés)
  - Jólformáltsági kényszerek: OCL
  - Dinamikus modellezés (állapottérképek)
- Domain-specifikus nyelvek
  - Az Eclipse Modeling Framework
  - Automatikus kódgenerálási technikák
  - Modell-lekérdezések (EMF-IncQuery keretrendszer)
  - Modelltranszformációk gráftranszformációk által
- SysML modellezés (beágyazott rendszerek)
- Architektúra modellezés (kritikus rendszerekben)
- Szoftverfejlesztési módszertanok és a modell-alapú megközelítés (SPEM, DO-331)
- Modell-menedzsment
- Meghívott előadás

# Models

What is a model?

---

## Mapping Feature

A model is based on an original (=system)

## Reduction Feature

A model only reflects a (relevant) selection of the original's properties

## Pragmatic Feature

A model needs to be usable in place of an original with respect to some purpose

---

## Purposes:

- descriptive purposes
- prescriptive purposes

# MDSE Equation

Models + Transformations = Software

# Modeling Languages

- **Domain-Specific Languages (DSLs):** languages that are designed specifically for a certain domain or context
- DSLs have been largely used in computer science. Examples: HTML, Logo, VHDL, Mathematica, SQL
- **General Purpose Modeling Languages (GPMLs, GMLs, or GPLs):** languages that can be applied to any sector or domain for (software) modeling purposes
- The typical examples are: UML, Petri-nets, or state machines

# Types of models

- **Static models:** Focus on the static aspects of the system in terms of managed data and of structural shape and architecture of the system.
- **Dynamic models:** Emphasize the dynamic behavior of the system by showing the execution
  
- Just think about UML!

# Domain Specific Modeling Languages

Concrete syntax  
(Graphical/Textual)

Abstract syntax  
(Metamodel)

Well-formedness  
constraints

Behavioural semantics,  
Simulation

Code  
generation

Mapping

```
</membership>  
<profile defaultProvider="Sitefinity">  
  <providers>  
    <clear/>  
    <add name="Sitefinity" connections</add>  
  </providers>  
  <properties>  
    <add name="FirstName"/>  
    <add name="LastName"/>  
    <!-- SNP specific properties -->  
    <add name="NickName" />  
    <add name="Gender" />  
  </properties>  
</profile>
```

Foundations of many modern tool  
(design, analysis, V&V)

- Domains: avionics, automotive, business modeling

# Metamodeling

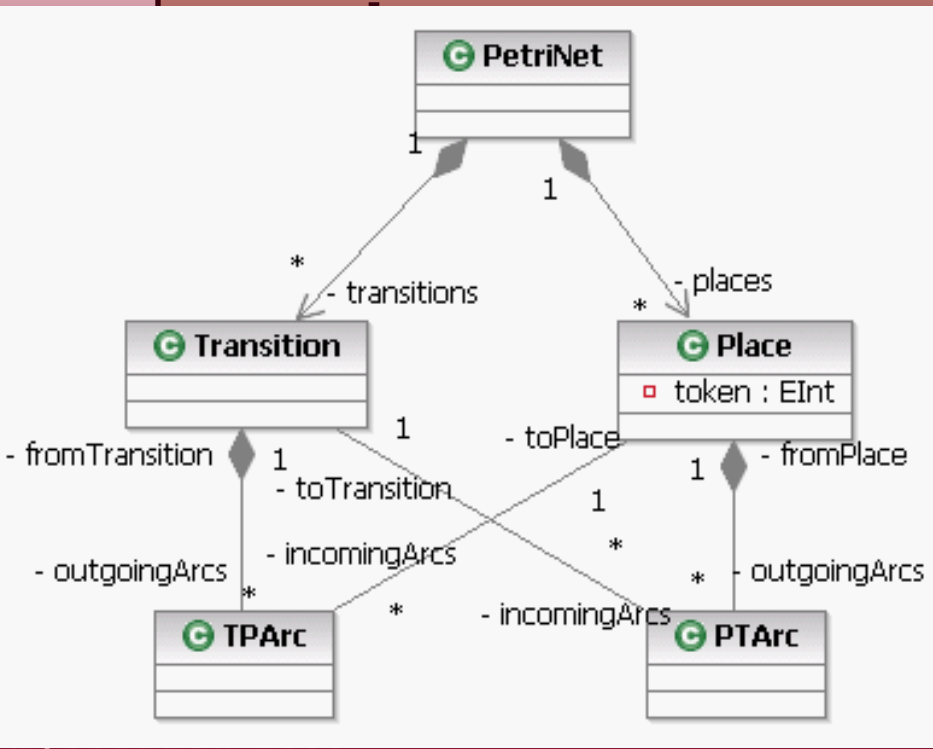

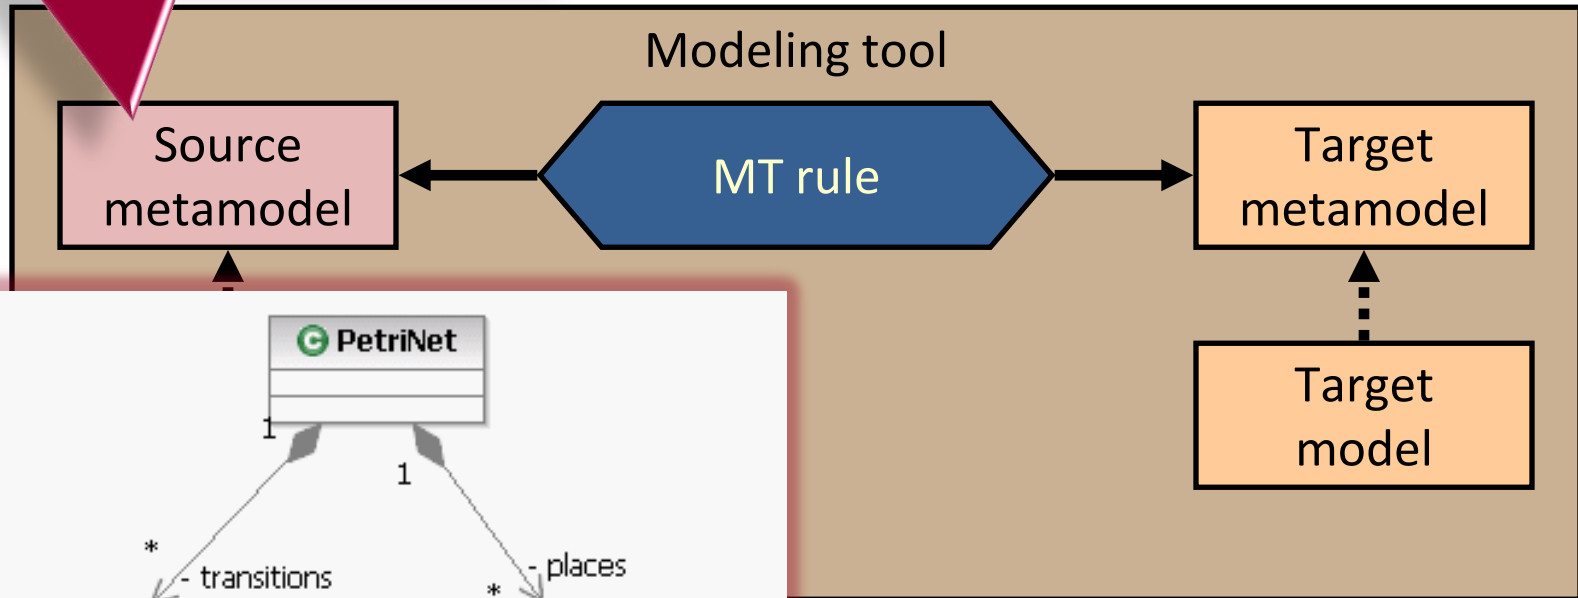

- To represent the models themselves as “instances” of some more abstract models.
- **Metamodel** = yet another abstraction, highlighting properties of the model itself
- Metamodels can be used for:
  - defining new languages
  - defining new properties or features of existing information (metadata)

# Model Transformation Overview: Metamodels

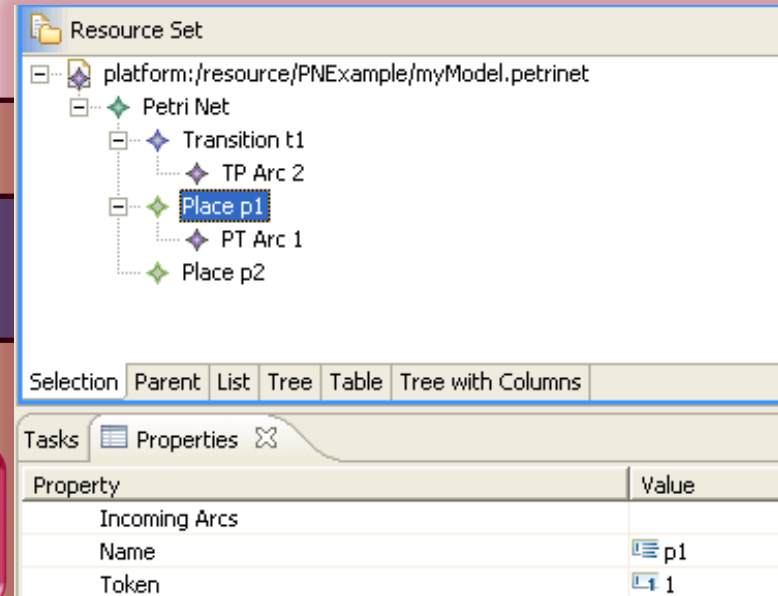

Metamodel: Precise spec of a modeling language

# Model Transformation Overview: Models

## Eclipse Modeling Framework (EMF):

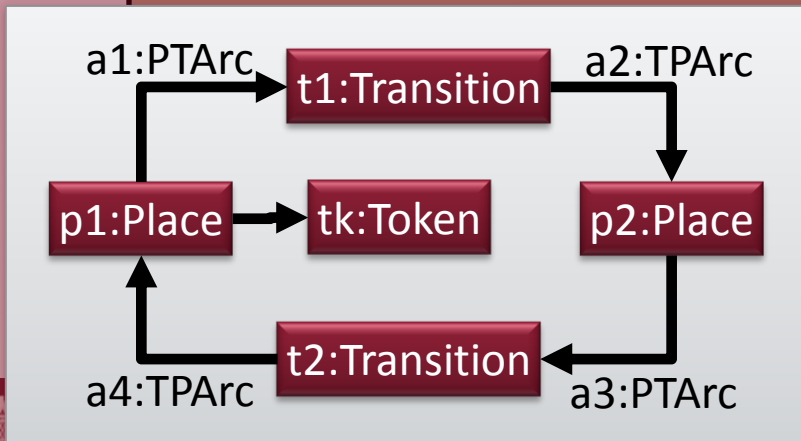

- De facto modeling standard for Eclipse based modeling tools
- Design metamodel  $\rightarrow$  auto-generate interface, implementation, tree editor...
- Examples:  
UML, AADL, SysML, BPMN, AUTOSAR  
>30 in a single IBM tool

Property	Value
Incoming Arcs	
Name	p1
Token	1

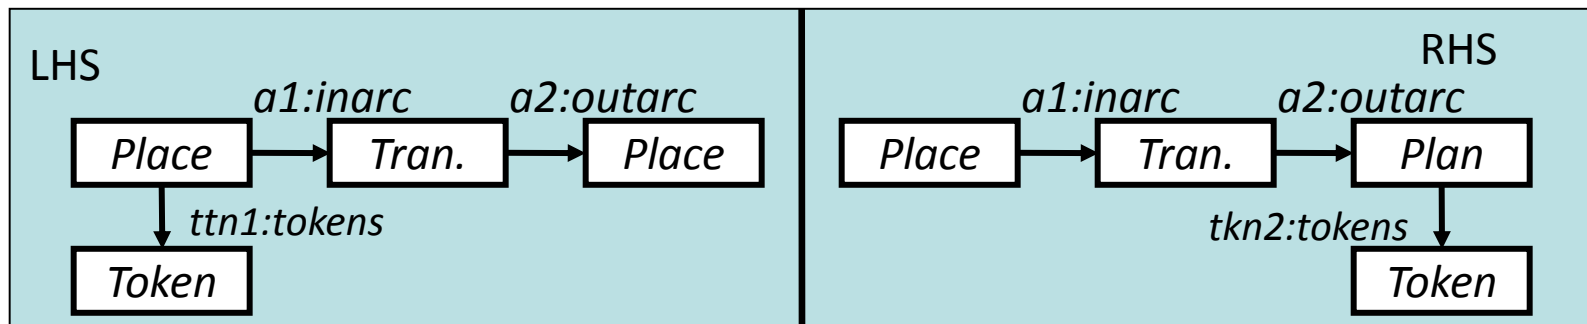

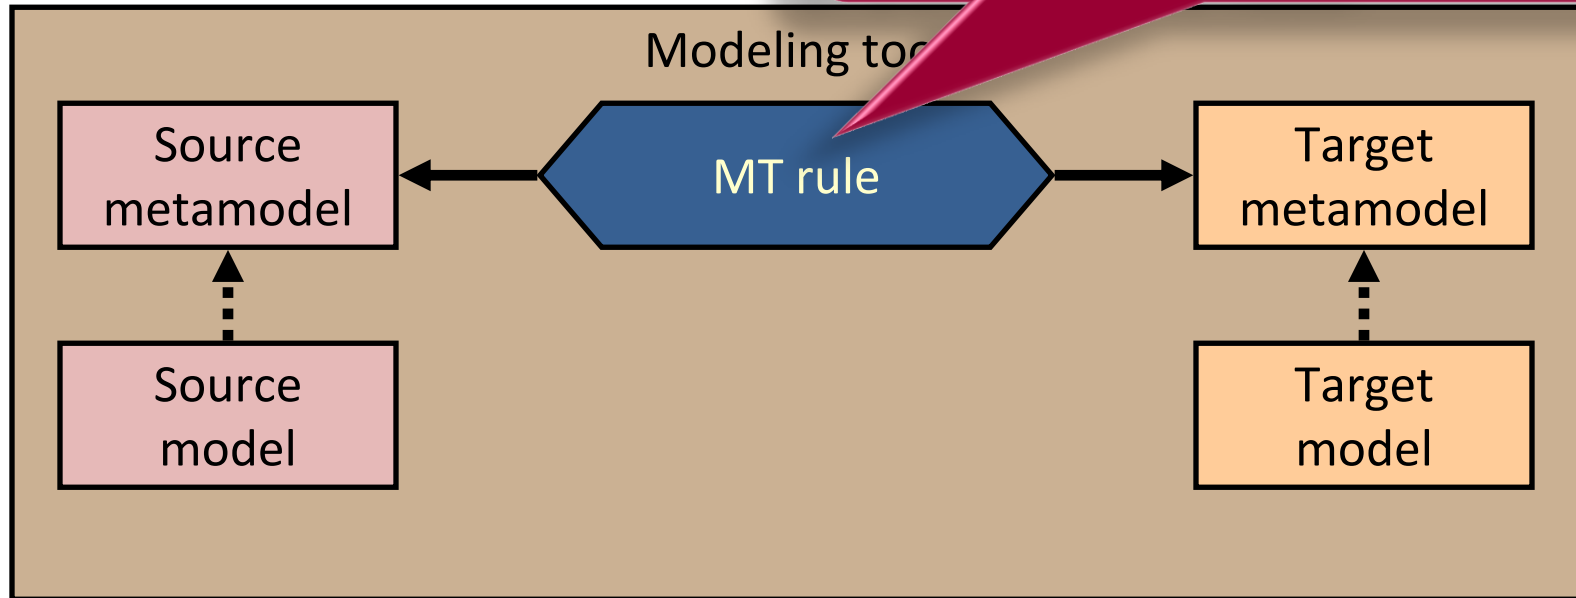

Source model

Model: Description of a concrete system

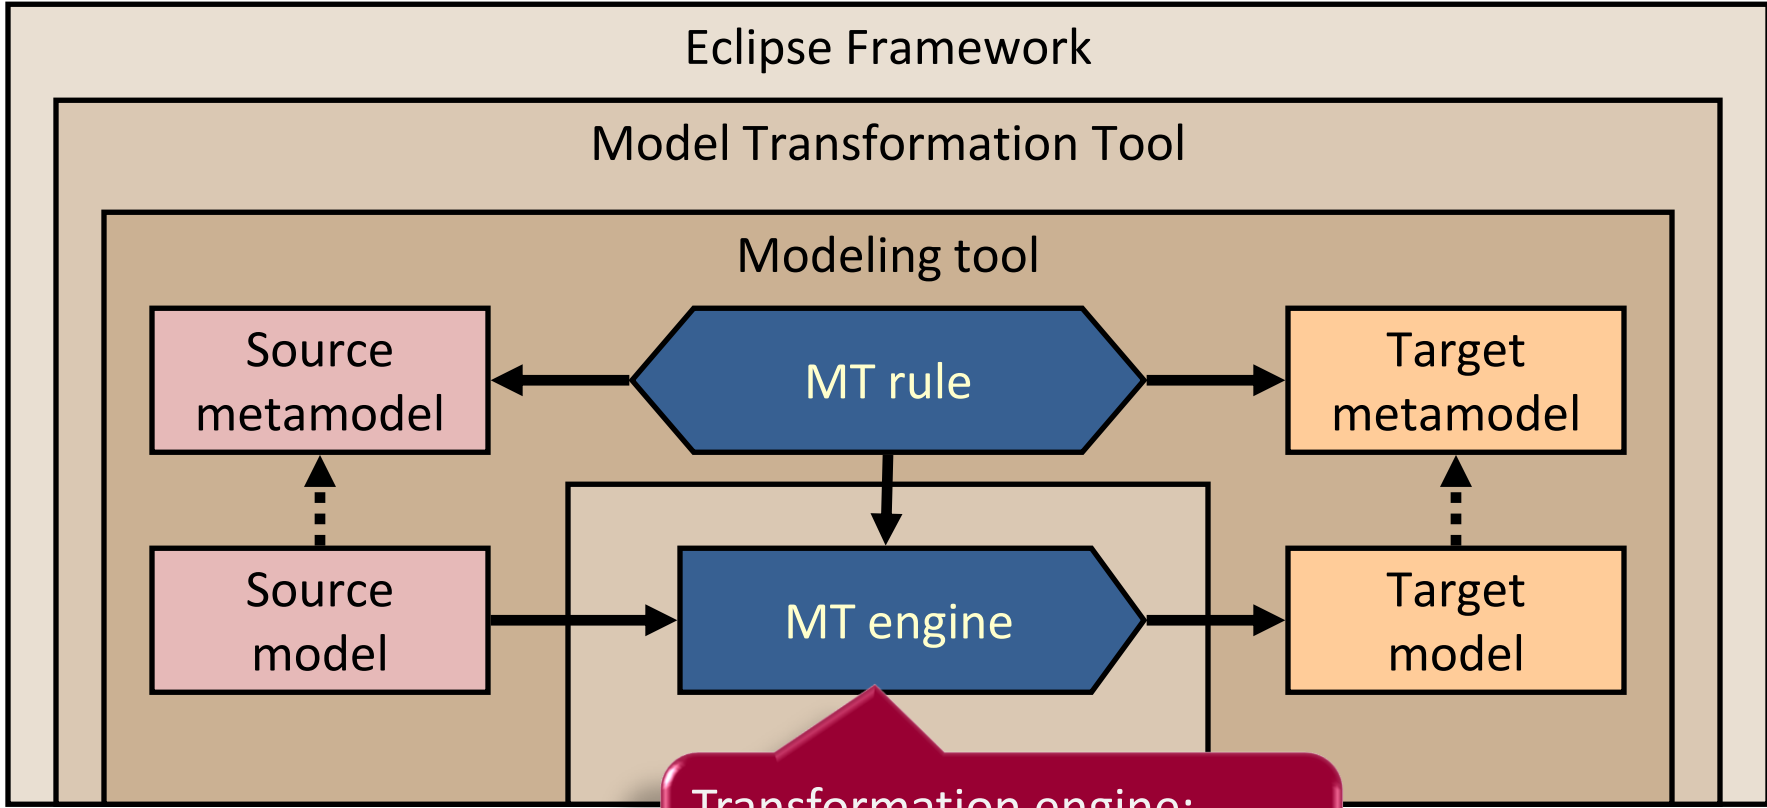

# Model Transformation Overview: Rules

Model Transformation:  
How to generate a target equivalent of  
an arbitrary source model

# Model Transformation Overview: Rule Execution

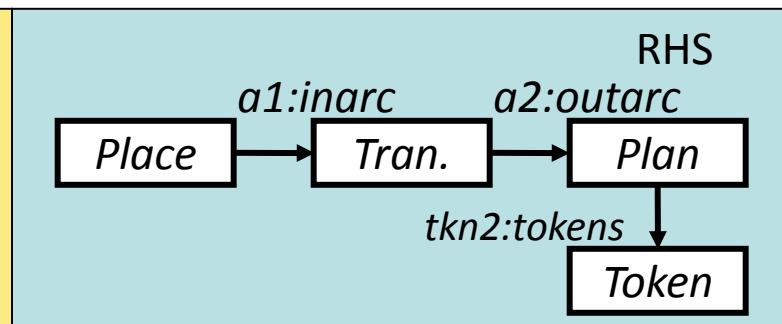

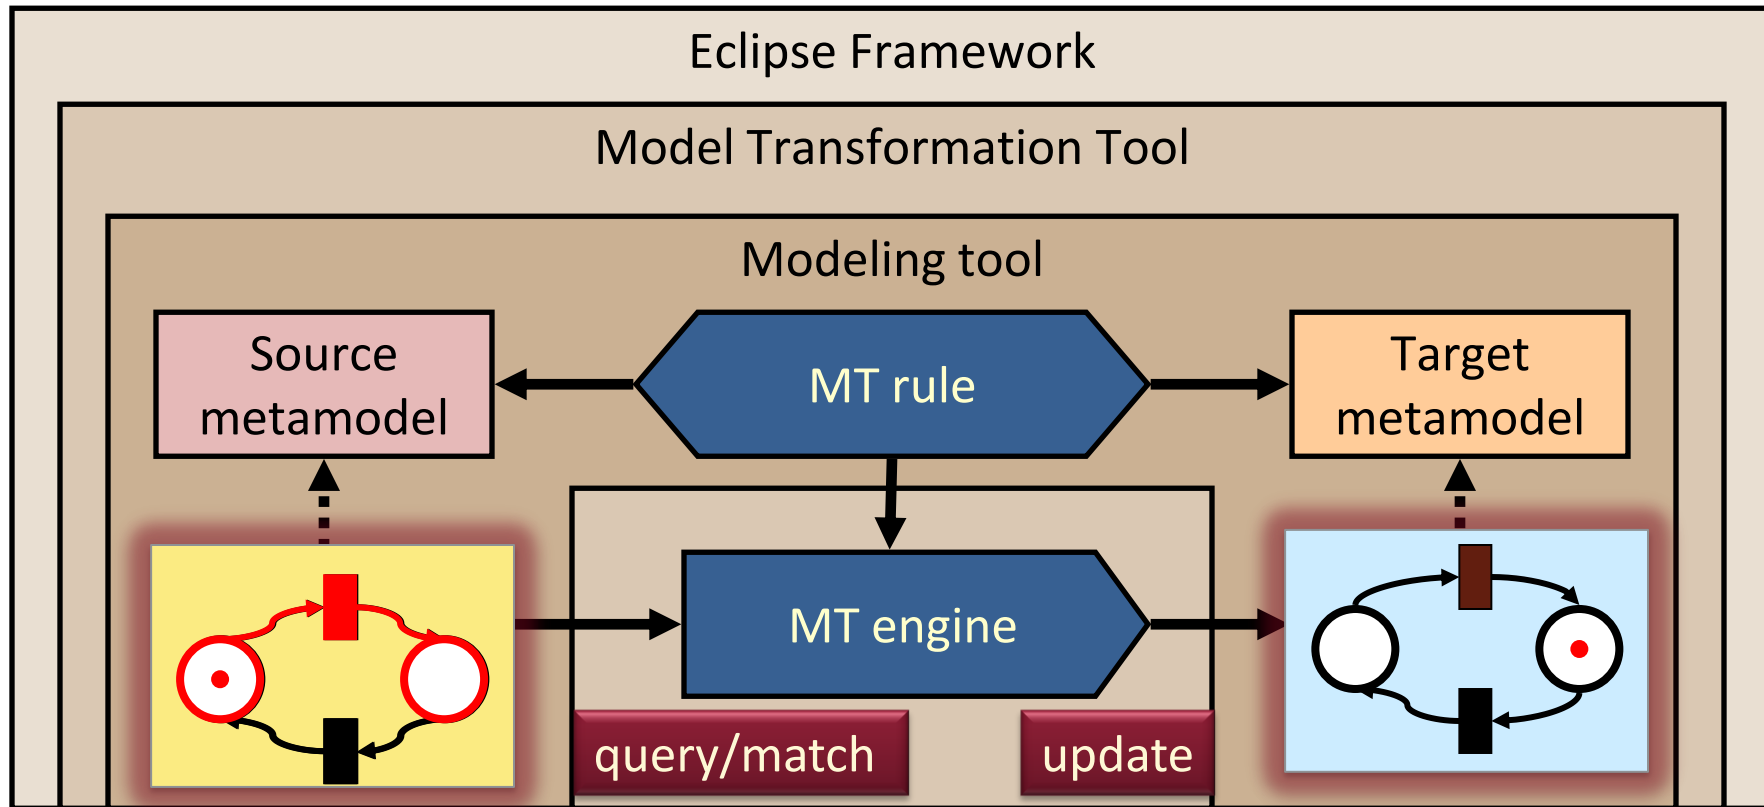

Transformation engine:  
Support for querying and  
manipulating large models

# A Classification of Transformations

# Concepts

Model Engineering basic architecture

# Concepts

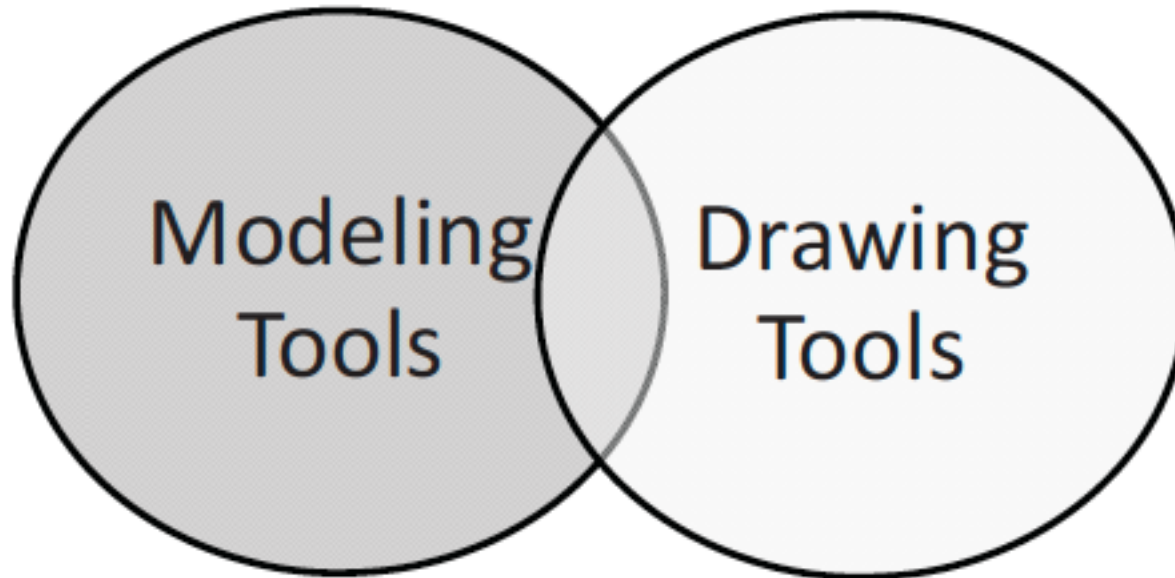

## Consequences or Preconditions

- **Modified development process**
  - Two levels of development – application and infrastructure
    - Infrastructure development involves modeling language, platform (e.g. framework) and transformation definition
    - Application development only involves modeling – efficient reuse of the infrastructure(s)
  - Strongly simplified application development
    - Automatic code generation replaces programmer
    - Working on the code level (implementation, testing, maintenance) becomes unnecessary
    - *Under which conditions is this realistic ... or just futuristic?*
- **New development tools**
  - Tools for language definition, in particular meta modeling
  - Editor and engine for model transformations
  - Customizable tools like model editors, repositories, simulation, verification, and testing tools

# Tool support

- Drawing vs. modeling

# Motivations for MDSD

# Traditional motivations for MDSE

## Principles and objectives

- **Abstraction** from specific realization technologies
  - Requires modeling languages, which do not hold specific concepts of realization technologies (e.g., Java EJB)
  - Improved **portability** of software to new/changing technologies – model once, build everywhere
  - **Interoperability** between different technologies can be automated (so called Technology Bridges)
- **Automated code generation** from abstract models
  - e.g., generation of Java-APIs, XML Schemas, etc. from UML
  - Requires expressive and precise models
  - Increased **productivity** and **efficiency** (models stay up-to-date)
- **Separate development** of application and infrastructure
  - Separation of application-code and infrastructure-code (e.g. Application Framework) increases **reusability**
  - **Flexible** development cycles as well as **different development roles possible**

# Model-Driven Engineering of Critical Systems

## Traditional V-Model

## Model-Driven Engineering

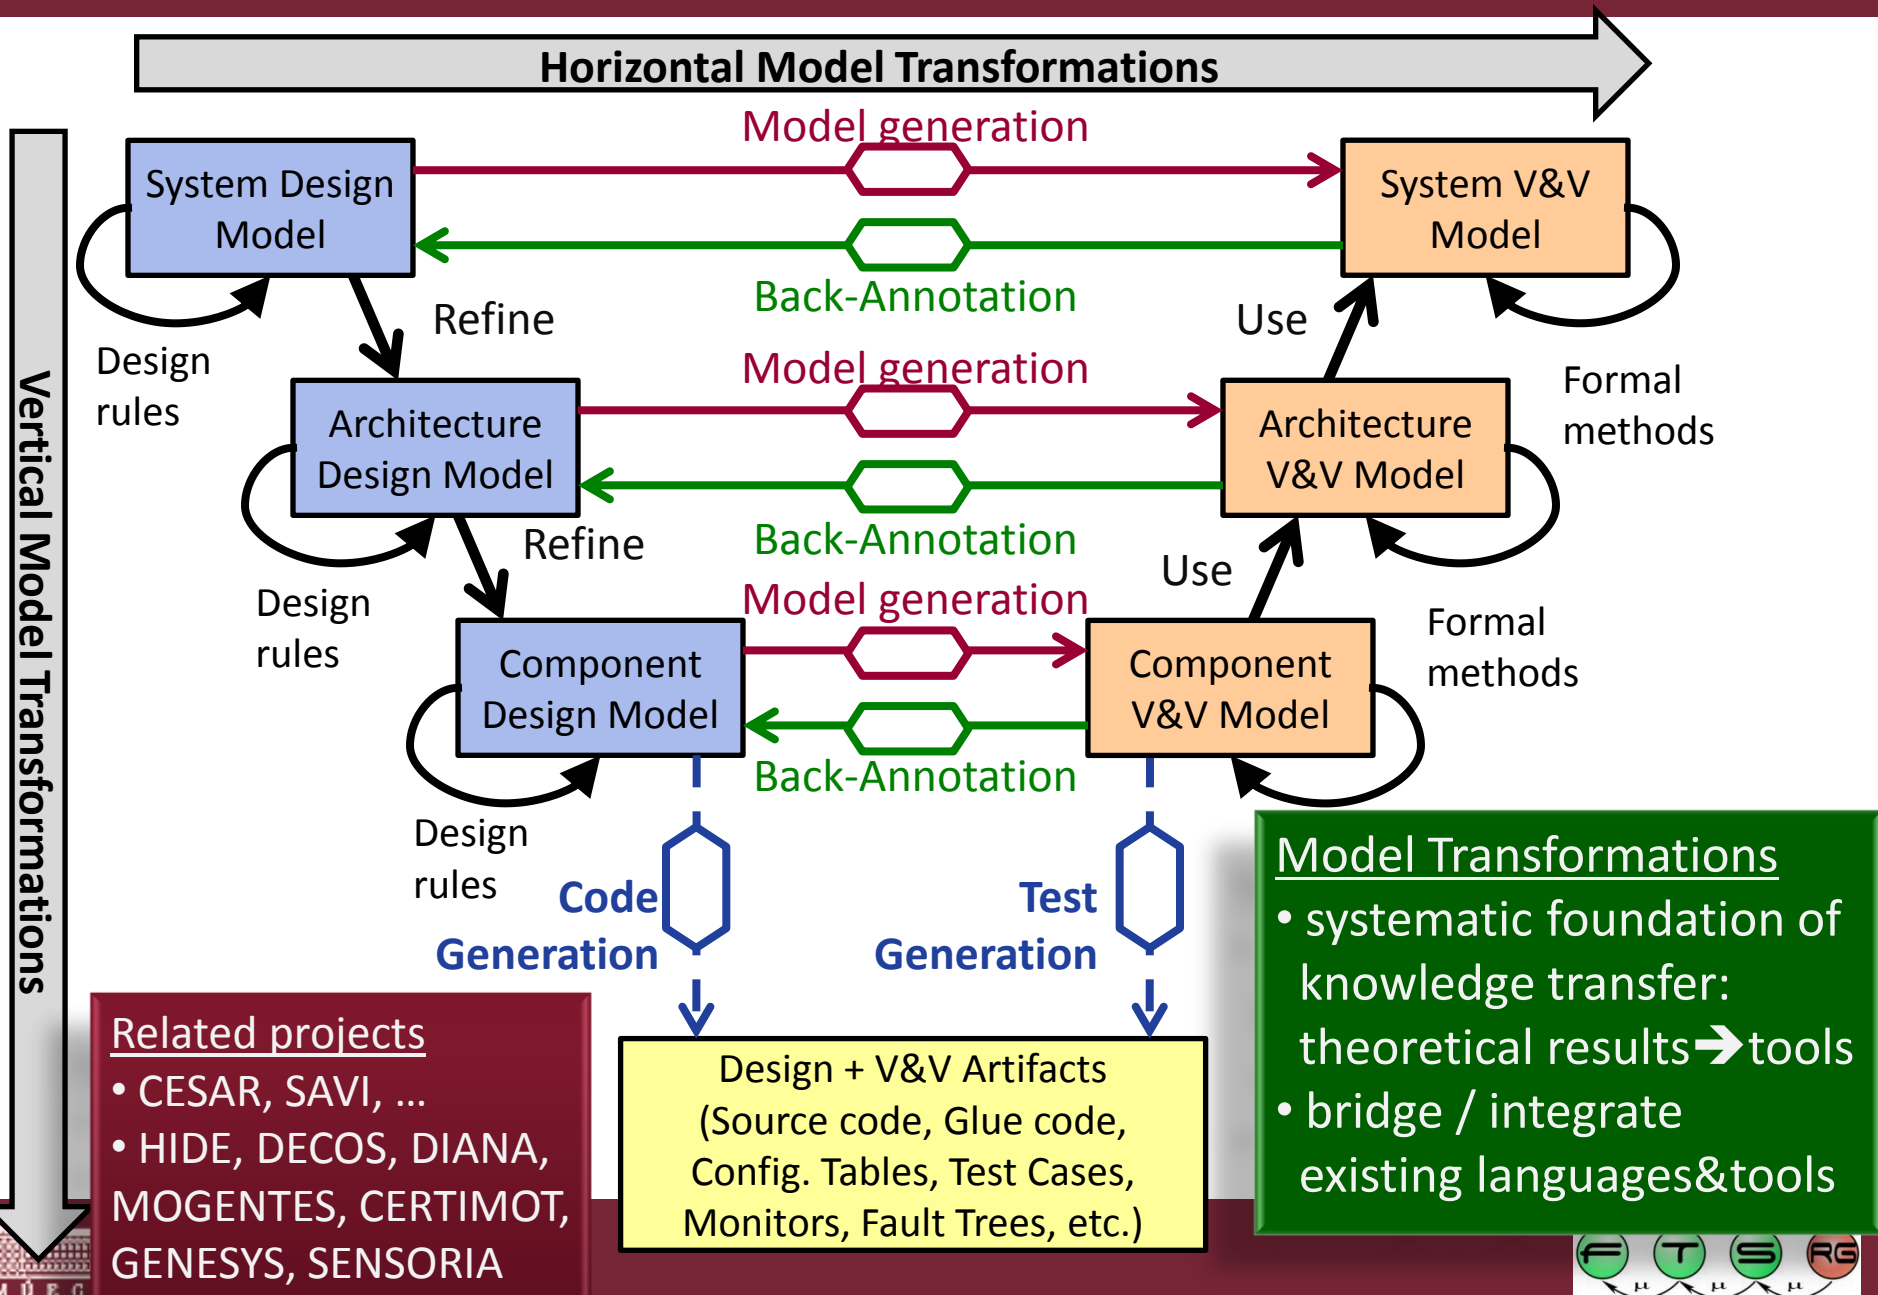

- DO-178B/C: Software Considerations in Airborne Systems and Equipment Certification (RTCA, EUROCAE)
- Steven P. Miller: Certification Issues in Model Based Development (Rockwell Collins)

### Main ideas of MDE

- early validation of system models
- automatic source code generation
- ➔ quality++ tools ++ development cost--

# Models and Transformations in Critical Systems

# MDA = Model-Driven Architecture

# The MD\* Jungle of Acronyms

- **Model-Driven Development (MDD)** is a development paradigm that uses models as the primary artifact of the development process.
- **Model-Driven Architecture (MDA)** is the particular vision of MDD proposed by the Object Management Group (OMG)
- **Model-Driven Engineering (MDE)** is a superset of MDD because it goes beyond of the pure development
- **Model-Based Engineering** (or “model-based development”) (**MBE**) is a softer version of ME, where models do not “drive” the process.

# The MDA Approach

## Goals

- **Interoperability** through Platform Independent Models
  - Standardization initiative of the Object Management Group (**OMG**), based on OMG Standards, particularly **UML**
  - Counterpart to CORBA on the modeling level: interoperability between different platforms
  - Applications which can be installed on different platforms → portability, no problems with changing technologies, integration of different platforms, etc.
- **Modifications to the basic architecture**
  - Segmentation of the model level
    - **Platform Independent** Models (PIM): valid for a set of (similar) platforms
    - **Platform Specific** Models (PSM): special adjustments for one specific platform
  - Requires model-to-model transformation (PIM-PSM; compare QVT) and model-to-code transformation (PSM-Code)
  - Platform development is not taken into consideration – in general industry standards like J2EE, .NET, CORBA are considered as platforms

[[www.omg.org/mda/](http://www.omg.org/mda/)]

# Modeling Levels

CIM, PIM, PSM

- **Computation independent (CIM):** describe requirements and needs at a very abstract level, without any reference to implementation aspects (e.g., description of user requirements or business objectives);
- **Platform independent (PIM):** define the behavior of the systems in terms of stored data and performed algorithms, without any technical or technological details;
- **Platform-specific (PSM):** define all the technological aspects in detail.

# Modeling levels

MDA Computation Independent Model (CIM)

- E.g., business process

# Modeling levels

MDA Platform Independent Model (PIM)

- specification of structure and behaviour of a system, abstracted from technological details

- Using the UML(optional)

- Abstraction of structure and behaviour of a system with the PIM simplifies the following:
  - Validation for correctness of the model
  - Create implementations on different platforms
  - Tool support during implementation

# Modeling levels

## MDA Platform Specific Model (PSM)

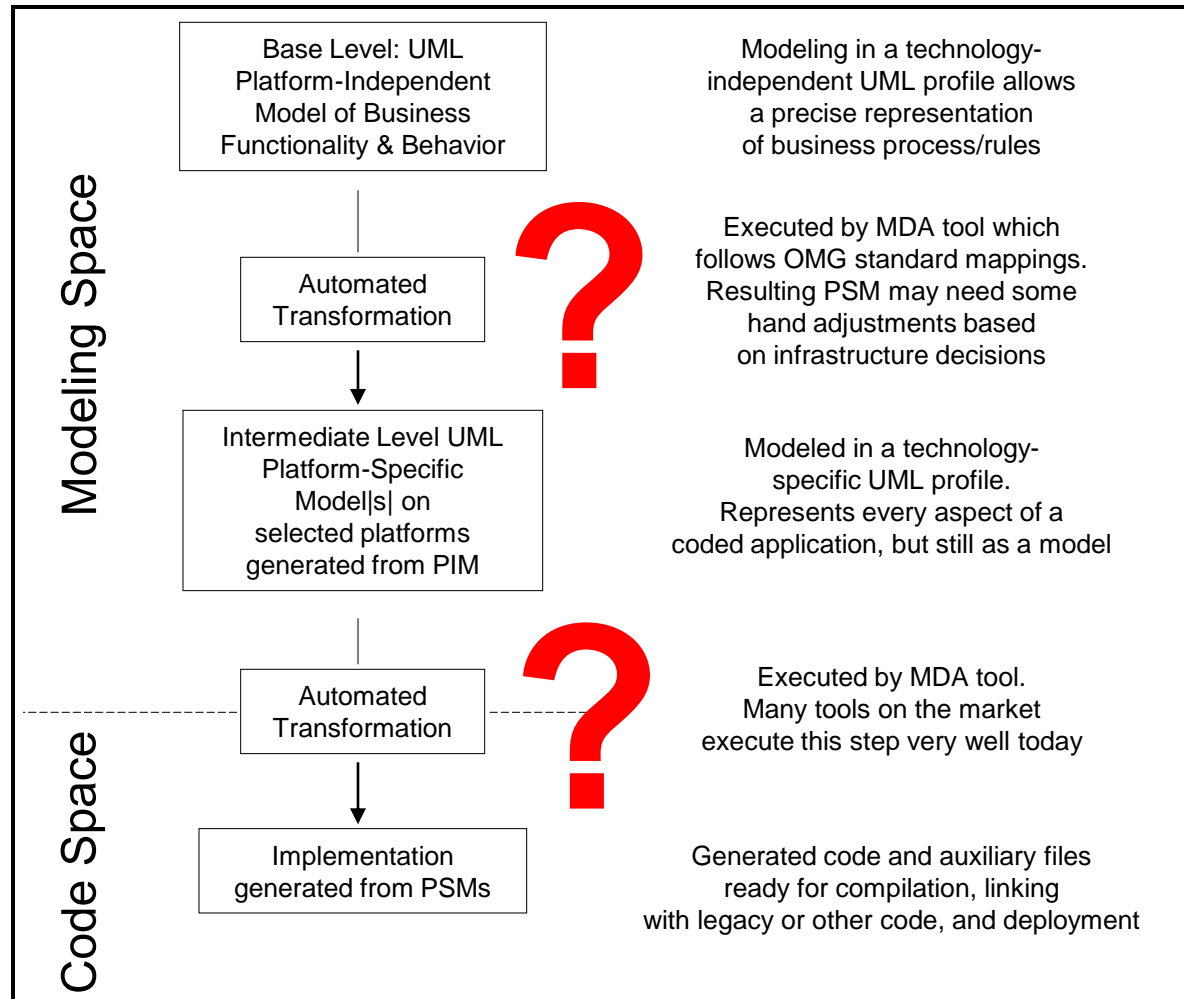

- Specifies how the functionality described in the PIM is realized on a certain platform
- Using a UML-Profile for the selected platform, e.g., EJB

# The MDA Approach

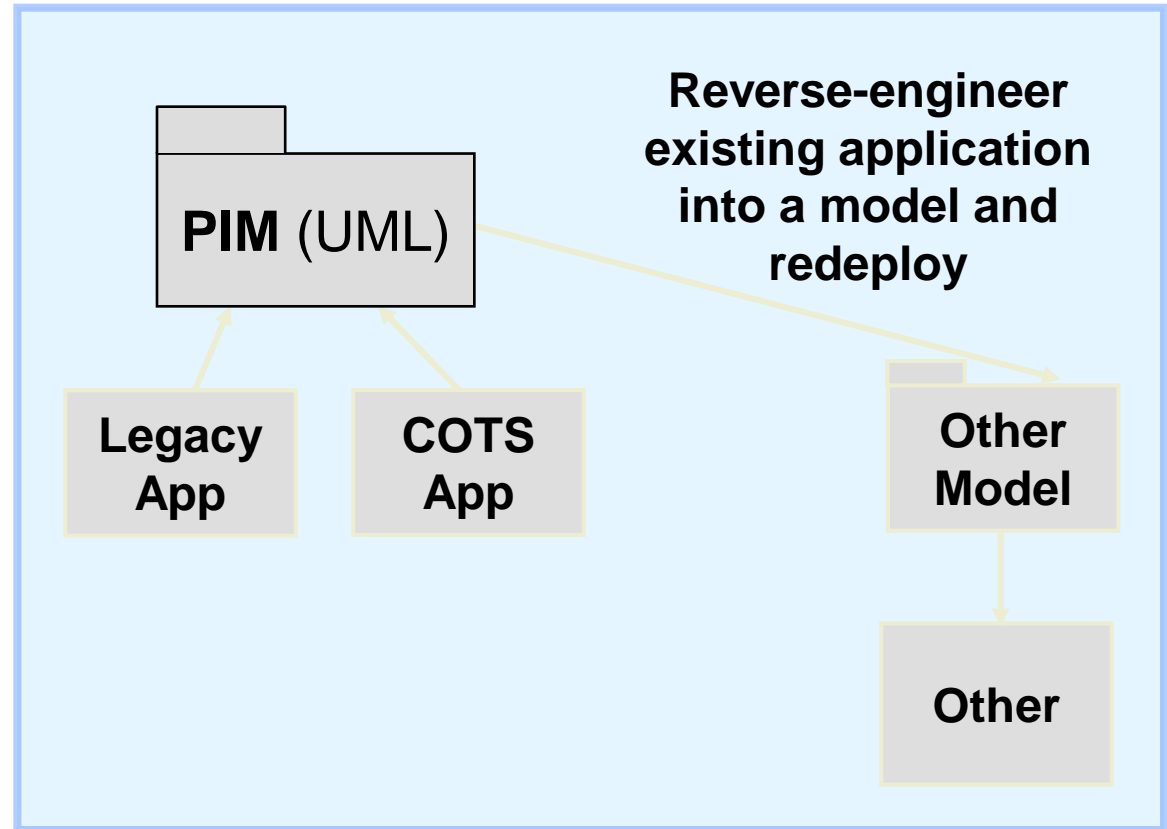

MDA development cycle

# Approaches

MDA Reverse Engineering / Roundtrip Engineering

- Re-integration onto new platforms via Reverse Engineering of an existing application into a PIM and subsequent code generation
- MDA tools for Reverse Engineering automate the model construction from existing code

# Approaches

Excursus: OMG Standards

- CORBA - Common Object Request Broker Architecture
  - Language- and platform-neutral interoperability standard (similar to WSDL, SOAP and UDDI)
- UML - Unified Modeling Language
  - Standardized modeling language, industry standard
- CWM - Common Warehouse Metamodel
  - Integrated modeling language for Data Warehouses
- MOF – Meta Object Facility
  - A standard for metamodels and model repositories
- XMI - XML Metadata Interchange
  - XML-based exchange of models
- QVT – Queries/Views/Transformations
  - Standard language for Model-to-Model transformations

# Summary

- MDSE = Models + Languages + Transformations
- Motivation
  - Early validation of design
  - Automated generation of design artifacts
  - + Interoperability, Productivity, Abstraction, Reuse
- MDA = Model Driven Architecture
  - 3 modeling levels: CIM + PIM + PSM
  - Automated transformations: PIM → PSM → Code (?)

# History of MD\*

# Approaches

## Executable UML

- “CASE with UML”
  - **UML-Subset**: Class Diagram, State Machine, Package/Component Diagram, as well as
  - UML Action Semantic Language (ASL) as programming language
- **Niche product**
  - Several specialized vendors like Kennedy/Carter
  - Mainly used for the development of Embedded Systems
- **One part of the basic architecture** implemented
  - Modeling language is predetermined (**xUML**)
  - Transformation definitions can be adapted or can be established by the user (via ASL)
- **Advantages** compared to trad. CASE tools
  - Standardized modeling language based on the UML
- **Disadvantages** compared to trad. CASE tools
  - Limited extent of the modeling language

[S.J. Mellor, M.J. Balcer: Executable UML: a foundation for model-driven architecture. Addison-Wesley, 2002]

# Approaches

## MDA with UML

- Problems when using **UML** as PIM/PSM
  - Method bodies?
  - Incomplete diagrams, e.g. missing attributes
  - Inconsistent diagrams
  - *For the usage of the UML in Model Engineering special guidelines have to be defined and adhered to*
- Different requirements to **code generation**
  - get/set methods
  - Serialization or persistence of an object
  - Security features, e.g. Java Security Policy
  - *Using adaptable code generators or PIM-to-PSM transformations*
- **Expressiveness** of the UML
  - UML is mainly suitable for “generic” software platforms like Java, EJB, .NET
  - Lack of support for user interfaces, code, etc.
  - *MDA tools often use proprietary extensions*

# Approaches

## MDA

- Many **UML tools** are expanded to MDA tools
  - UML profiles and code generators
  - Stage of development partly still similar to CASE: proprietary UML profiles and transformations, limited adaptability
- **Advantages** of MDA
  - Standardization of the Meta-Level
  - Separation of platform independent and platform specific models (reuse)
- **Disadvantages** of MDA
  - No special support for the development of the execution platform and the modeling language
  - Modeling language practically limited to UML with profiles
  - Therefore limited code generation (typically no method bodies, user interface)

# Approaches

## AC-MDSD

- **Efficient reuse of architectures**
  - Special attention to the efficient reuse of infrastructures/frameworks (= architectures) for a series of applications
  - Specific procedure model
    - Development of a reference application
    - Analysis in individual code, schematically recurring code and generic code (equal for all applications)
    - Extraction of the required modeling concepts and definition of the modeling language, transformations and platform
  - Software support ([www.openarchitectureware.org](http://www.openarchitectureware.org))
- **Basic architecture almost completely covered**
  - When using UML profiles there is the problem of the method bodies
  - The recommended procedure is to rework these method bodies not in the model but in the generated code
- **Advantages compared to MDA**
  - Support for platform- and modeling language development
- **Disadvantages compared to MDA**
  - Platform independence and/or portability not considered

# Approaches

MetaCASE/MetaEdit+

- Free configurable CASE
  - Meta modeling for the development of domain-specific modeling languages (**DSLs**)
  - **The focus** is on the ideal support of the **application area**, e.g. mobile-phone application, traffic light pre-emption, digital clock – Intentional Programming
  - Procedural method driven by the DSL development
- Support in particular for the **modeling level**
  - Strong Support for meta modeling, e.g. graphical editors
  - Platform development not assisted specifically, the usage of components and frameworks is recommended
- **Advantages**
  - Domain-specific languages
- **Disadvantages**
  - Tool support only focuses on graphical modeling

[[www.metacase.com](http://www.metacase.com)]

# Approaches

## Software Factories

- **Series production** of software products
  - Combines the ideas of different approaches (MDA, AC-MDSD, MetaCASE/DSLs) as well as popular SWD-technologies (patterns, components, frameworks)
  - Objective is the automatically processed development of software product series, i.e., a series of applications with the same application area and the same infrastructure
  - The SW-Factory as a marketable product
- Support of the **complete basic architecture**
  - Refinements in particular on the realization level, e.g. deployment
- **Advantages**
  - Comprehensive approach
- **Disadvantages**
  - Approach not clearly delimited (similar MDA)
  - Only little tool support

[J. Greenfield, K. Short: Software Factories. Wiley, 2004]

# Eclipse and EMF

- Eclipse Modeling Framework
- Full support for metamodeling and language design
- Fully MD (vs. programming-based tools)
- Used in this course!

# Conclusion

Modeling in the last century

- Critical Statements of Software Developers
- »When it comes down to it, the real point of software development is cutting code«
- »Diagrams are, after all, just pretty pictures«
- »No user is going to thank you for pretty pictures; what a user wants is software that executes«

M. Fowler, "UML Distilled", 1st edition, Addison Wesley, 1997

# Conclusion

Modeling in the new millennium – Much has changed!

- »When it comes down to it, the real point of software development is cutting code«
  - To model or to program, that is not the question!
  - Instead: Talk about the right abstraction level
- »Diagrams are, after all, just pretty pictures«
  - Models are not just notation!
  - Instead: Models have a well-defined syntax in terms of metamodels
- »No user is going to thank you for pretty pictures; what a user wants is software that executes«
  - Models and code are not competitors!
  - Instead: Bridge the gap between design and implementation by model transformations
  - What about the managers?

M. Fowler, "UML Distilled", 1st edition, Addison Wesley, 1997  
(revisited in 2009)

## Chapter #2

# MDSE PRINCIPLES

Teaching material for the book

## **Model-Driven Software Engineering in Practice**

by Marco Brambilla, Jordi Cabot, Manuel Wimmer.

Morgan & Claypool, USA, 2012.
