# **Domain Modeling**

#### Model Driven Systems Engineering Lecture 2

## Metamodel: Specify Concepts an Appl. Domain

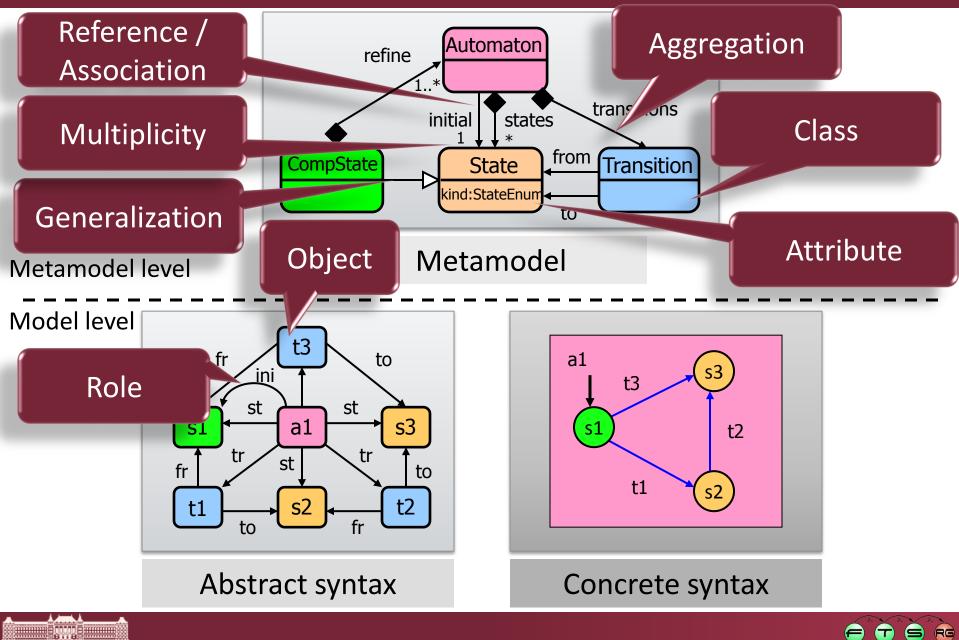

#### Metamodel:

- Precise specification of domain concepts
- A language for defining the abstract syntax of a DSM
- Goal: to define...
  - Basic concepts
  - Relations between concepts
  - Attributes of concepts
  - Abstraction / refinement (Taxonomy, Ontology) between model elements
  - Aggregation
  - Multiplicity restrictions
  - Derived features

## Metamodels and instance models

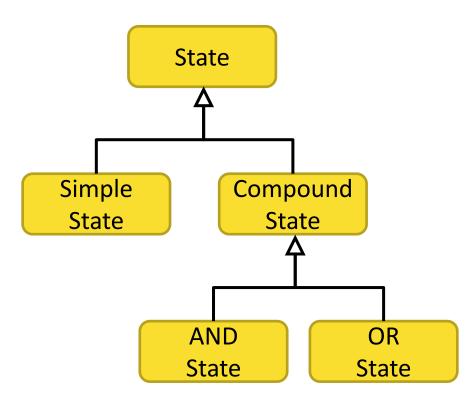

## **Classes and Objects**

# Type hierarchy

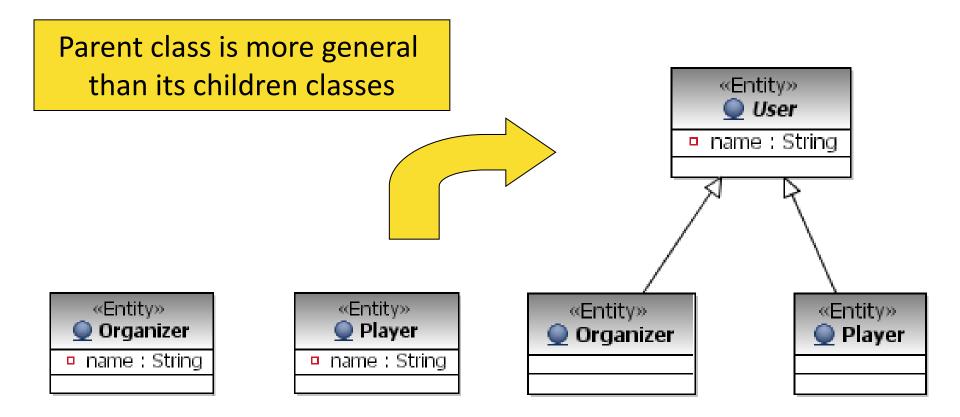

- Generalization
  - $\circ \cong$ Inheritance
  - Transitive
  - o Reflexive? / Irreflexive?
- How to read?
  - SimpleState is a subclass of State
  - State is a superclass of SimpleState
- Substitutability
  - Subclass instead of Superclass
  - Superclass instead of Subclass

## **Typical Use of Generalization**

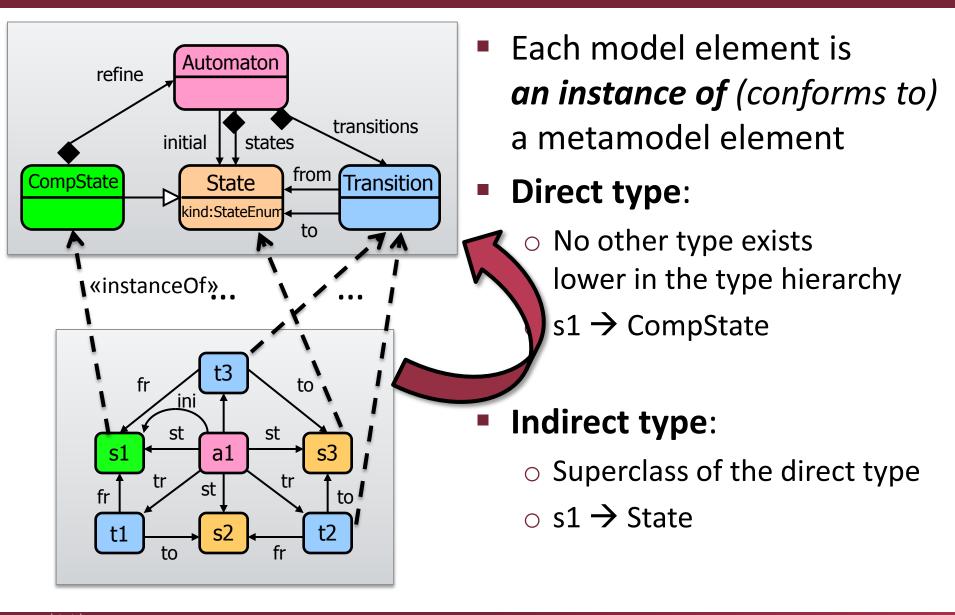

Aim: Lift up common attributes and methods to the superclass

## Type conformance /Instantiation /Classification

# Classification vs. Generalization

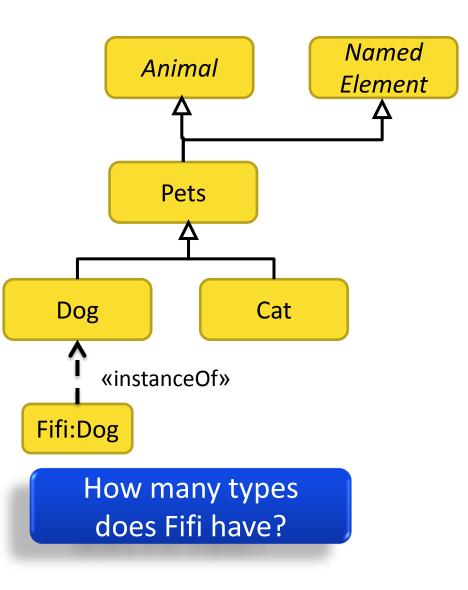

- 1. Fido is a Poodle
- 2. A Poodle is a Dog
- 3. Dogs are Animals
- 4. A Poodle is a Breed
- 5. A Dog is a Species

- ✓ 1+2 = Fido is a Dog
- ✓ 1+2+3 = Fido is an Animal
  - 1+4 = Fido is a Breed
- ! 2+5 = A Poodle is a Species
  - Generalization (SupertypeOf) is transitive
  - Classification (InstanceOf) is NOT transitive

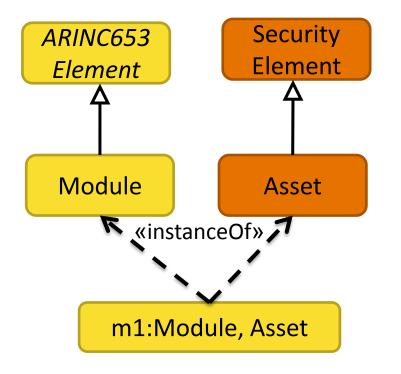

# Multiple inheritance

- Multiple inheritance:
  - A class in the metamodel has more than 1 supertype
  - Typical use: merge features from different classes
    - One is generic, thus reused in different domains (cf. NamedElement)
    - Other is a general but domain-specific superclass (cf. Animal)
- Restriction:
   For each model element:
   a single type

# Multiple classification

- Multiple typing / classification:
  - One model element typed against multiple metamodels
  - Rationale: Multi-paradigm / view modeling
  - UML Stereotypes
- Restriction:
   For each model element:
   a single type in a domain

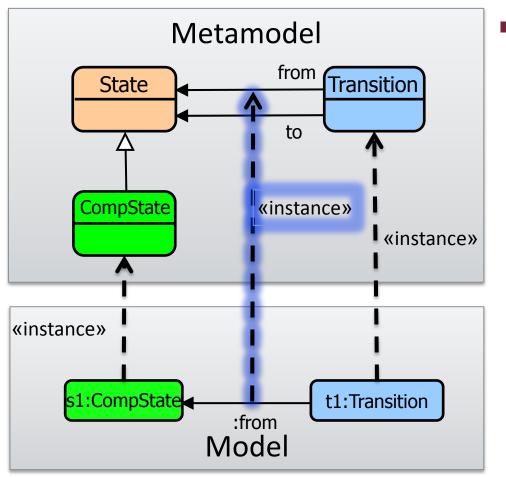

### **References and Links**

# Type conformance of references

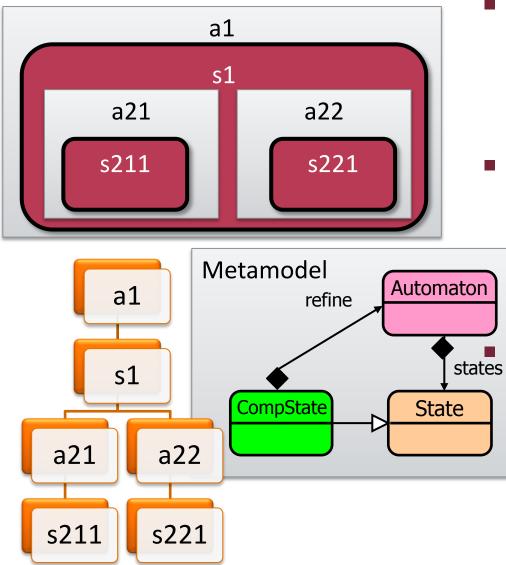

Can you define generalization for references?

- A link in a model is
   type conformant if
  - type(src(link)) is subtype of src(type(link))
  - type(trg(link)) is subtype of trg(type(link))
  - Informally:
    - The type of the source object is a subtype of the source class of the link's type.
    - The type of the target object is a subtype of the target class of the link's type.

# Containment hierarchy

- Each model element has a unique parent
  - $\circ$  N children  $\rightarrow$  1 parent
  - Single root element
- Aggregation as relationship:
  - Defined in the metamodel along reference edges
  - Provides restriction for instance models

#### Circularity

- No circular containment (in the model)
- Aggregation relations in the metamodel may be circular (hierarchy)

RG

Т

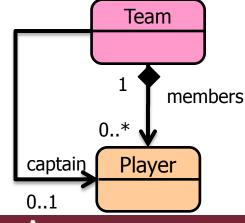

# **Multiplicity restrictions**

Definition: Lower bound .. Upper bound

 Lower bound: 0, 1, (non-negative integer)
 Upper bound: 1, 2, ... \* (positive integer + any)

Scope:

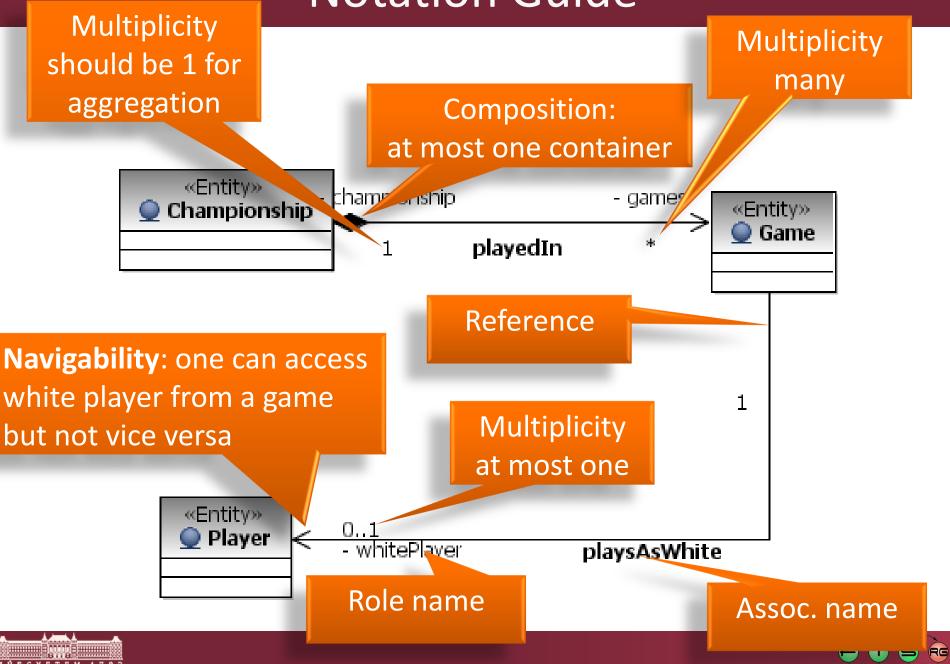

- References: allowed number of links between objects of specific types
- Attributes: e.g. arrays of strings (built-in values)

Which are the most common multiplicity definitions in practice?

# Advanced Concepts and Best Practices

In Domain Modeling

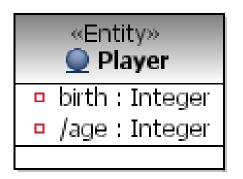

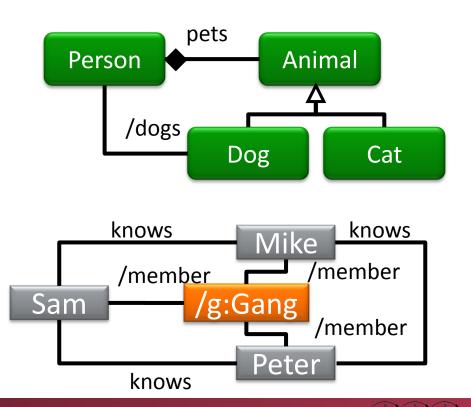

# **Derived Features**

- A derived feature can be calculated from others
  - Usage: helpers for designers / tools
  - It need not be persisted
  - Automatic updates
- Derived attributes: age = currYear - birth
- Derived references: dogs = -- pets --> Dog
- Derived objects:

"Gang":
 everyone knows everyone

RG

## Enumerations

#### Enumeration:

- a fixed set of symbolic values
- represented as a class with values as attributes

#### Usage:

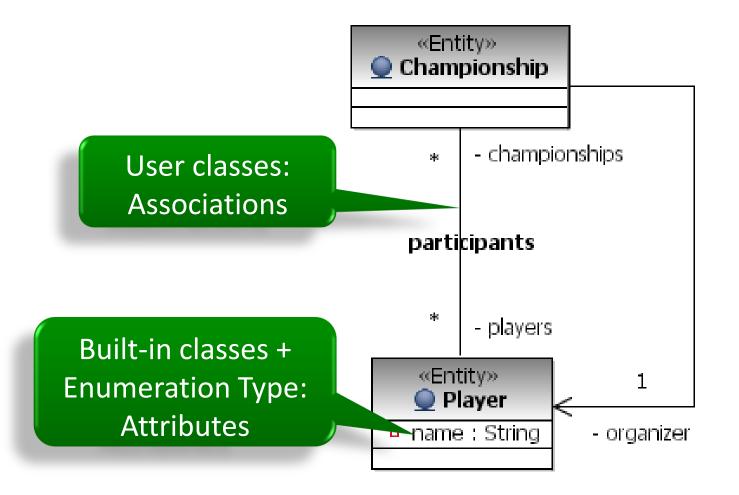

- Frequently define possible states
- Use enumerations instead of hard-wired String literals whenever possible

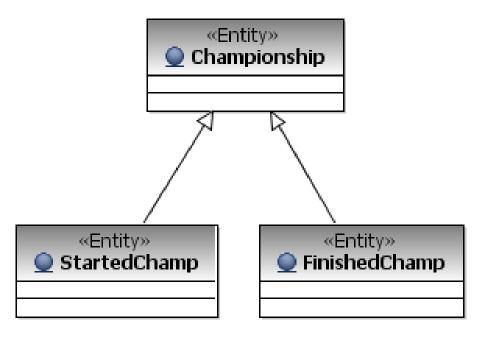

## Built-in classes vs. User defined classes

# When to avoid generalization?

«enumeration» IE ChampStatus	
0	Announced
0	Started
0	Finished

Cancelled

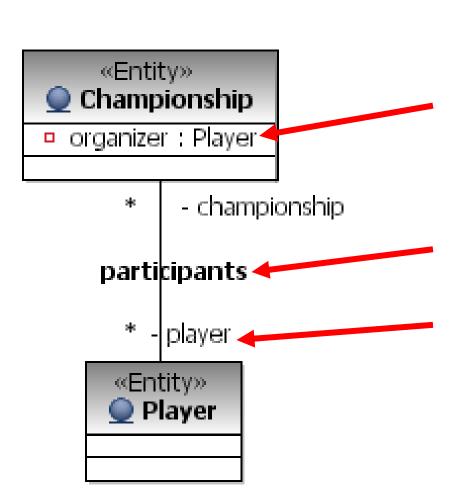

- What happens if a started championship is finished?
- Problem: Retyping of an object is required

#### NOTE:

Use status attribute with enumeration values to store the state of an object that can change

# What is Bad Design/Smell here?

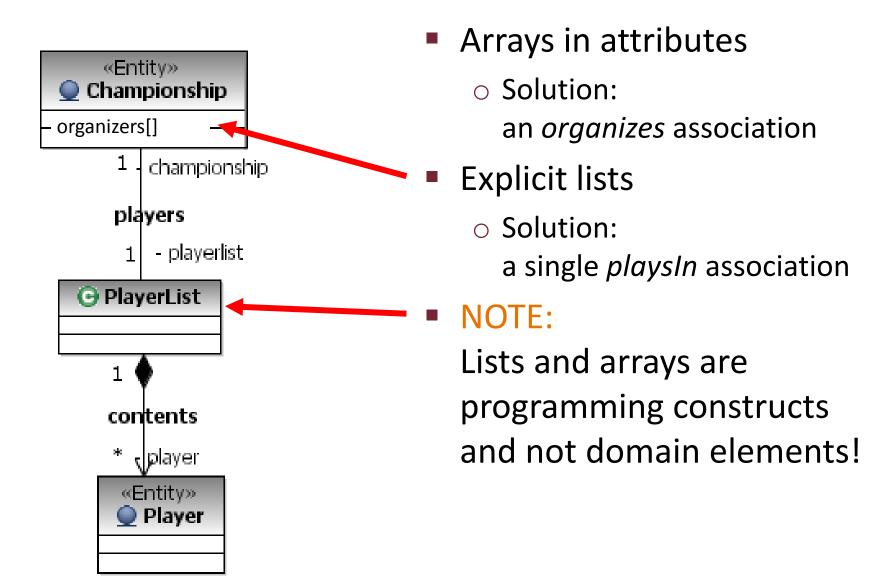

- Properties of a user defined type (class) should rather be denoted explicitly
  - OK, if multiplicity is 1
- Naming of associations:
  - prefer verbs to nouns
  - OK: participatesIn, participantsOf
- Naming of roles:
  - $\circ$  1: singular
  - o \*: plural
  - OK: players, championships

# What is Bad Design/Smell here?

## **Domain Modeling Examples**

**Practical exercises** 

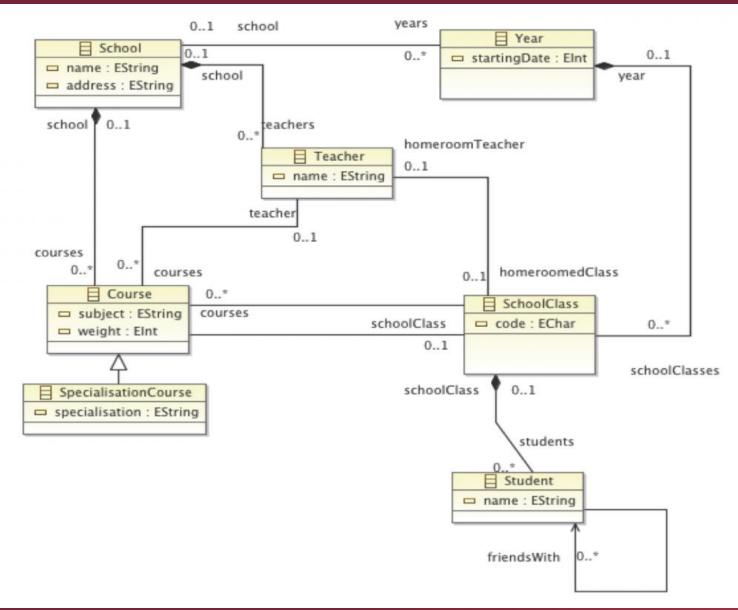

# The School Domain

- A school (identified by its name and address) has teachers as employees who teach courses (identified by their subject) in different years.
- Each class in a specific school year has a headmaster (homeroom) teacher
- Students of a specific year attend their own classes, and they may be friends with each other
- Teachers and students are identified by their names.
- Specialization courses can be taken by 11th and 12th grade students

## The School Domain

# Paper Review System: The Story

- The paper review system is used by authors who log in electronically for the conference and then fill in a form including their name, the most important attributes of the paper to be submitted (such as title, abstract), and mark the conference topics related to the paper. The paper itself is usually submitted by a later deadline using the paper ID received when registering the paper. Later the authors may observe the reviews received for their paper. If their paper gets accepted by the program committee, the final version of the paper needs to be uploaded to the system
- The paper review system is also used by the reviewers, who receive their login parameters in email. They need to fill in their contact details for the conference chair when logging in to the system for the first time.
- After skimming through the titles and abstracts of submitted papers, each reviewer indicates their conflicts (i.e. those paper where the authors are close colleagues or former co-author). He or she also indicates those topics where he or she is an expert.
- The conference chair assigns the papers to at least three reviewers using semi-automated assistance from the system. The basis of assignment is the relevant topics indicated by the reviewers.
- The reviewers fill a review form to evaluate the paper from different aspects including a three-line summary, originality, strong and weak points, reviewer's confidence, author comments, confidential comments. The most important part is the overall recommendation, which can be a score and a textual assessment ranging from strong reject to strong accept.
- Finally, the conference chairs decide on the acceptance or rejection of each paper and send a notification mail to the authors together with the reviews of the paper.

## The Paper Review System
