

Introducing the Validation Mechanism of the Dynamic Multi-Layer Algebra

Sándor Bácsi

Budapest University of Technology and Economics
Department of Automation and Applied Informatics

Outline

1. What is Multi-Level Modeling?
2. Dynamic Multi-Layer Algebra (DMLA)
3. Validation mechanism of DMLA
4. Conclusions

Introduction

What is multi-level modeling?

The evolution of concepts

- Software evolution
 - Starts from *Something*
 - Ends with a *concrete product*
 - During the evolution
 - Abstraction level is reduced
 - Level of freedom is decreased
- Classic object-oriented method
 - Two-level style (Fixed number of abstraction levels)
 - Classes and objects
 - Limitations

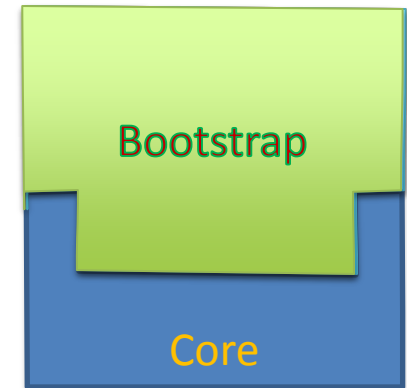

Multi-level metamodeling

Dynamic Multi-Layer Algebra (DMLA)

DMLA: Core - Bootstrap

- Core (the “HW”)
 - Based on Abstract State Machines
 - *Data structure and management*
 - 4-tuple {ID, Meta, Values, Attributes}
- Bootstrap (the “operating system”)
 - Set of entities, enabler of modeling
 - Defines metamodeling foundation
 - *Basic building blocks* (modelling+operations)
 - Can be replaced with another bootstrap

DMLA: Entities and slots

- Entity
- Slot (placeholder for the value + constraints)

slot Seat: CE.Children

- SType: TypeConstraint
- SCard: CardinalityConstraint
- SMaterial: CustomConstraint

Seat Component

1..3

this.Material == container.Frame.Material

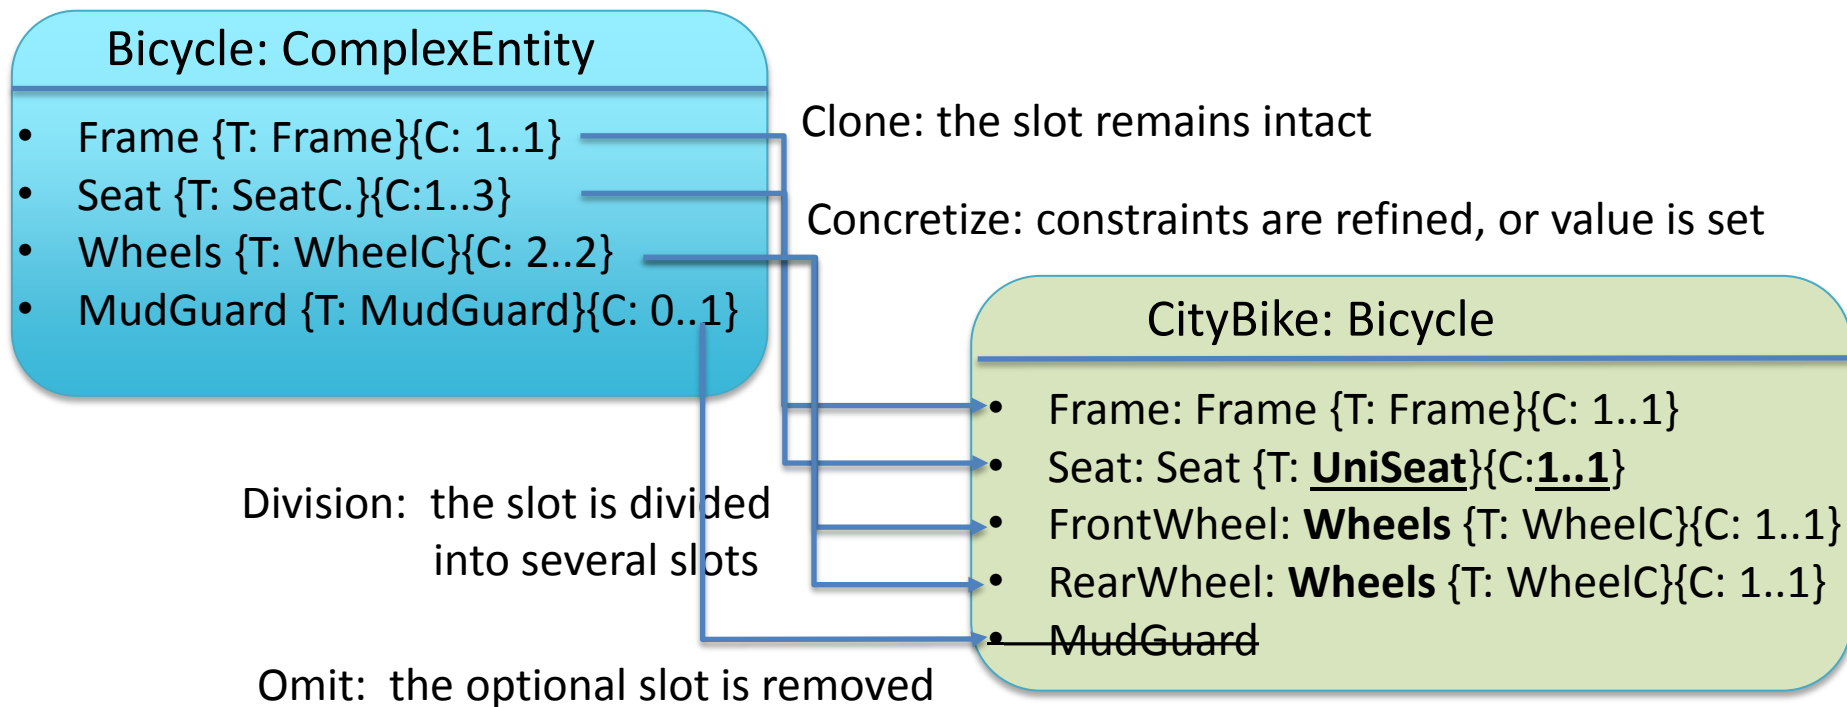

Bicycle: ComplexEntity

- Seat {T: SeatC.} {C: 1..3}
- Wheels {T: WheelC.} {C: 1..2}
- Frame {T: FrameC.} {C: 1..1}

Bicycle

DMLA: Entities and slots

- Slot behavior
 - Clone: the slot remains intact
 - Concretize: constraints are refined, or value is set
 - Division: the slot is divided into several slots
 - Omit: the optional slot is removed

Validation Mechanism of DMLA

DMLA – Validated operations

- Goal: self validating Bootstrap (without an external language)
- Key: we need to *model the operations*
- AST elements → Bootstrap
- Java executor for carrying out the validation
- Operation definitions are built from entities
 - A high level script language (DMLAScript)

Alpha formulae

- Meta – instance (1:1, e.g. type)
- **REQ:** *A professional racing bike has a professional race frame which is made of aluminum or carbon and has a minimum weight of 5200 gr.*

```
operation Bool ID::ProRaceFrameAlpha(ID instance){  
  
    ID material = call $GetRelevantAttributeValue(instance, $BicycleComponent.Material)  
    if (material!=null && material!=$Material_Carbon  
        && material!=$Material_Aluminium) return false;  
  
    Number weight= call $GetRelevantAttributeValue(instance, $Component.Weight);  
    if (weight!=null&& weight>5200) return false;  
  
    return true;  
}
```

Beta formulae (1:n)

Configuration: BicycleEntity

Children: ComplexEntity.Children {T: \$Base, C: 0..*}

Components: ComplexEntity.Children {T: \$Component, C: 0..*}

Ncycle: Configuration

Children: ComplexEntity.Children {T: \$Base, C: 0..*}

Components: ComplexEntity.Children {T: \$Component, C: 0..*}

Fork: Configuration.Components {T: \$Fork, C: 1..1}

Seat: Configuration.Components {T: \$Seat, C: 1..3}

Wheel: Configuration.Components {T: \$Wheel, C: 1..2}

Bicycle: Ncycle

Tandem: Ncycle

Unicycle: Ncycle

Gamma formulae

- Instance – whole model (1:*, e.g. uniqueness)
- **REQ:** *Components must have a unique serial number.*

```
slot SerialNumber: ComplexEntity.Children;
```

```
@Base.GammaValidation.C  
@Base.GammaValidation.T  
@Base.GammaValidation.OpSig  
slot ComponentGamma : Base.GammaValidation =  
    operation Bool ID::UniqueFrameId()  
    {  
        //...  
    }
```

Soft validation in DMLA

- Failing the validation criteria automatically produces invalid models
- One may need a “softer” method that is rather a filtering mechanism
- **REQ:** *A racing bike is not suited for tough terrain.*

```
slot IsSuitable : Bicycle.IsSuitable =  
  operation Bool ID::IsSuitableFor_Race(ID checkCondition){  
    if (checkCondition == $SuitableFor_ToughTerrain)  
      return false;  
    else  
      return true;  
  }
```

Conclusions

Conclusions

- Limitations:
 - Parallel and incremental validation
- Currently working on:
 - VM over DMLA
 - New language over DMLAScript for domain modeling
 - Visualization of the models
